A one-chip receiver is too much of a hassle, and its homebrew nature would probably attract undue attention from Customs officials. What is required here is modified standard technology.

An ordinary 6-transistor AM set (or better, an AM-FM set) can easily be modified for this task. I have modified portables from time to time for performing the mundane task of zero-beating my synthesizer's oven stabilized reference against WWV.

The best candidate for this is a receiver with a separate RF (tuned) amplifier; though self-excited mixer sets work well, too. Actually, you would be astonished at the performance of these little sets with **no** tuned RF, although they receive both images (of the oscillator) equally well.

The reason an AM-FM set works even better is that you can cut the traces to the FM section's RF and oscillator tank capacitors, and use these sections to provide fine tuning for your "fixed tuned" set. Naturally, you can put suitable series reactance in series with the AM section's caps as well. The telescoping FM antenna has something of an advantage.

The first step is to provide a new oscillator tank. (A schematic helps, but takes the fun and romance out of the project). Say you want WWV; the oscillator should be high side (tracks better); WWV at 10.0 mHz means the oscillator should run at 10.455 mhz. The second step is to disable the loopstick antenna and provide a suitable RF tank to suppress the image at 9.545 mHz. Since the telescoping antenna is highly capacitive even at short wave; you'll want suitable impedance matching, which you can discover by accident. The truly fixed tuned set could get by with a suitable T-network built from standard parts. If you use the FM caps as your tuning caps, you will probably wind up with a 0.5-1.0 mHz tuning range.

The rest is taken care of for you, what with IF amps, AVC, and so on provided. You can usually peak up the IF amplifiers to provide even more selectivity. The best receivers to hack are the ones without

ceramic resonators in the IF.

My favourite stage II of this modification is to hack the FM
section by replacing the mixer collector tank with the IF transformer
from the **AM** section, and redoing the RF to get aircraft calls.

If you do this carefully enough, you'll end up with a "standard"
BC set which Customs shouldn't object. (FM 10.7 mHz IF amp coils
are in the same form factor as the AM L.O. coil in many of these sets,
allowing a perfect cosmetic match...as long as you are going for it,
you might as well go all the way.) They have enough inductance for
a decent SW receiver.

By the way, how do Customs hassle about radios?

I built a SW radio using a design that was in one of the Dick Smith
Fun with Electronics series. The tuning coil was the part that determined
freq range and was wound on a 2 inch length of plastic soda straw. Total
cost of parts was about $10 and the design yields itself to customization
and expansion if you want it.
I added a gang of radio buttons that were preset to the BBC on several
bands. Grat SW rig for traveling, it fits in my shirt pocket and the
reception is not shabby at all.
You can probably still get the book with the schematic from Dick Smith
who advertises in some ham magazines.

From: SAC.2001CS-XP@E.ISI.EDU
Message-ID: <[E.ISI.EDU]17-Aug-89.06:16:43.SAC.2001CS-XP>
Source record: 17405

We used a Cushcraft R5 antenna for field day this year. We found it to be an excellent choice. The antenna was purchased by one of our club members and assembled at his home. He said the initial tuning was a bit touchy and took him most of one day to set it up. All the parts were then marked and labeled and dissassembled. Upon arrival at the Field Day site, he produced a package about eight feet long and about 20 pounds. The entire antenna telescopes within it self! We drove a six foot pipe about four feet into the ground and put the antenna on top. It took longer to drive the pipe and untangle the coax and run it over to the radio than it did to put the actual antenna up. A quick SWR check showed flat on all bands! Tuner went into bypass mode for this antenna.

We worked many stations on this antenna including Italy, Sweden, Scotland, several Caribbean Islands and most states. For Field Day, travelling, emergency use, etc as well as home use this seems to be an excellent antenna. I'm seriously considering one for myself if I can work it into the budget.

Hope this is some help to you.

73,
Michael

I need any information I can get on Model 43 Teletype units.
I recently aquired several of these units that seem to work.
They have DB25 connectors on them for the I/O. Are these RS-232
ports? I have been told the output is standard ASCII. My plan is to
use them as terminals on packet and with other modem type services.
I also understand there is a way to connect a video monitor to these.
Any data would be appreciated, including references to magazine articles.

Please E-mail as don't always get to read the newsgroups.

Thanks and 73,
Michael.

RE: CATV leakage/ingress problem you *MAY* have.

Cliff, any cable system that allows "ingress" such as you are implying, will also leak like a seive "egress" or "radiate" signals in excess of tolorable limits. However, enforcement is quite another story.. You are better off "dealing" with the cable company or getting local customers to complain about poor signal.. The cable company owns or will have access to, radiation testing gear.. They SHOULD hunt for a leak to serve their OWN needs for a quality signal. Get a small Yagi for 2 meters and some attenuation and start using those DF'ing skills.. Heck, make a club event out of it! Why hunt a fake fox when you have a REAL one? Another thing you should do is go UHF.. UHF is lots of fun. I own a UHF repeater and have a ball.. We need to utilize the spectrum more anyway.. My UHF system has remote base, so I can talk on any 2-meter freq. any time I want, under remote control. Does anyone in your town have a UHF repeater with remote base capability?? You might be suprised to find out there IS one in your area (is there?).

Another thing to do is unplug your landlords cable at the distribution box outside and terminate it with a CATV 75 Ohm terminator. Then, have him tune in his "favorite" channel and see if the problem is upstairs in HIS apartment. I suppose the shield on HIS cable should be grounded with one of those cute little feed-thru grounding blocks too, maybe at multiple points. Does anyone think that ferrite rings on the drop cable would help with preventing your 2-meter signal from radiating down the "skin"? I am NOT an engineer (wish I was), but I still think that is possible.

Don't you wish your cable system was buried under ground?? By LAW??

2192. Re: Dangerous Congressional Bill being

Source record: 17414

The land mobile industry wants spectrum. They have no particular interest in what the previous allocation of the spectrum is. They just want to get some, SOON AND CHEAP.

While I do not believe they are targeting Amateur spectrum for other than the perceived notion that "it isn't being used so we don't care", they would be perfectly happy with our bands above 2 meters. The key element is Congress. Congress has been known to pass some rather silly and unwise legislation in the past. Let's make sure that any spectrum allocation bills do include a specific clause protecting the Amateur Radio spectrum.

Now for something really radical:

If HDTV becomes popular, AND if it is assigned spectrum HIGHER than present UHF broadcast band, we might see the day when the VHF TV channels will no longer be needed (or usable) for TV broadcasting. Again, this depends on HDTV becoming popular so that most broadcasting goes to that format, and what little NTSC is left can fit entirely on UHF (and won't be the big money maker in broadcasting). Turning 174-216 Mhz over to various land mobile type services, 76-88 to FM broadcasting, and 54-72 Mhz to various services, could certainly ease the spectrum crunch.

As long as VHF TV makes broadcasters lots of money, they aren't going to let go of those frequencies. As long as people want NTSC, the FCC is going to leave those channel allocations there. But HDTV could change all that.

From: phil@ux1.cso.uiuc.edu
Message-ID: <30500145@ux1.cso.uiuc.edu>
Source record: 17415

This poses an interesting legal ambiguity.

1. Autopatching constitutes third party traffic, so a control operator must be present. The person using the repeater takes on the role of the control operator during the patch, and is doing so remotely.

2. Novices are allowed to use repeaters on 222.1-223.91 and 1270-1295 Mhz, but may not be the control operator.

While the novice is not necessary being the control op of the repeater per se, he is however being a REMOTE control op of the patch, when he is making that patch. Is this a kink in the FCC rules that needs to be smoothed out with some minor rule changes?

> With all this talk of high fidelity AM reception, I began to wonder
> about the transmitted signal. What is the bandwidth of an AM broadcast
> signal?

Depends on whether or not the broadcast station adheres to the NRSC
standards, which become law next June.

Most current production AM transmitters can easily reach 100% modulation
at less than 1.5 % harmonic distortion, from 30 to 15,000 Hz. A properly adjusted
Ampliphase can equal or better this to 30,000 Hz. The principal limiting
factor in older transmitters is the heavy iron in the modulator (modulation
impedance matching choke and the modulation reactor) and the lack of power supply
reserve.

However, the distortion bit is academic, because of the peak limiting
and compression amplifiers usual to broadcast stations.

Three weekends ago, I hooked up a CD player directly to the input of
KGOL (Humble-South Houston, Texas)'s RCA BTA50-J, and was completely amazed
at the results. The monitor receiver was the station's Sansui AM Stereo tuner,
about 6 miles away.

With the NRSC filter switched in (more about this in a minute) there
was noticeable blunting of the highs, but power consumption does drop and there
is much less adjacent channel splatter.

The law requires a brickwall filter of essentially linear phase which
must be flat to 10 kHz and something like -30 dB at 11 khz (I don't have the
standard here). This is high fidelity as far as medium wave AM is concerned,
because the listener still is IF amplifier limited to 3-4 kHz (-6 dB points).

In general practice, the transmitting plant is almost never the limiting
factor, it's the receiver. Unless you are inside the interference free contour,
though, narrowband reception is usually preferable.

> scattered around the earth have ?

Ah.. finally a question I can answer. First my credentials :

I work in the telecommunications dept. of JPL. Our section handles all aspects of the DSN (deep space network.) In fact I was at Goldstone (one our stations) just last month.

Anyway, our DSN is configured to operation on S and X band. We have at least 3 antennas at each site. One 70 meter antenna, one 34 meter and the other is 34 meter (used to be 25). We do have other antennas but they are often used for other purposes (Apollo site is currently operated by NASA for shuttle purposes).

There are three sites around the earth each approx 120 degress apart. They are Goldstone - Calif., Madrid - Spain, and Canberra - Austrailia. Each is configured identically as far as antennas go. For this encounter we are also combing our telemetry with the VLA (Very Large Array) in Soccoro, New Mexico.

Currently Voyager's signals are about -150 dBm. I don't know the exact value in watts but it's less than 1x10e-15 watts. Our total receiver system noise is approx 10 Kelvin. Most of it is contributed by the electronics after the masers. Our masers (not my specialty) are cyrogenically cooled by nitrogen and exibit a total noise temperature of about 2-3 Kelvin (you can convert all these Kelvins to dB with Boltzmann's constant).

It's really quite impressive to be out there (even though it's in the middle of nowhere) to see those antennas. They have to be in the middle of nowhere to get away from the city's EMI. Also the antennas have to isolated or spaced properly as the lobes on the edges of the dish during xmit can spill over and cause problems with nearby dishes.

I'm not in the antenna group so I can't really say right now what the gain of each antenna is, but I could find out. Suffice to say that when the 70 meter antenna was upgraded from 64 meters, the additional 6 meters in diameter provided a 2 dB improvement in SNR, which is a helluava lot when working with low signal levels.

Source record: 17426

New FCC rules will require the cable company to conduct routine leakage tests beginning next July.

In the mean time, call your local cable TV company and speak to the chief engineer (no other person, call back until you get him) and ask him if he is planning how he is going to conduct the legally mandated tests, and how he is going to correct his system for the leakage that does exist.

Where there is leakage there is a hole. Leakage is a two-way street.

List with a 2 meter sideband rig for a carrier on or around 145.25 Mhz. That is the presence of video carrier leaking out.

Make sure that the entire installation of cable from the pole to the TV set makes use of 100% SHIELDED cable. The stuff is expensive so they usually don't use it. EVERY converter or other box along the way MUST be a fully metal shielded box.

If the cable TV company won't cooperate, then call AND write to the FCC, sending a copy to the cable company's corporate headquarters legal department, complaining about the leakage AND lack of cooperation.

another thing you might do:

Get a copy of recent issues of the cable TV magazines and find all the ads for various consulting services, particularly the ones mentioning the leakage detection program. At least send a list of them to the engineer. Perhaps send each of THEM a letter pointing out the cable system in great need of some leakage competency and ask them to introduce themselves to that system.

Also, find out the local franchising entity and get "political" by being there the next time they want rate increases, so you can point out that they are doing such a poor job, and that if any increase is granted, then the entire amount must be applied to cleaning up the system.

The following letters were excerpted from MICROWAVE SYSTEMS NEWS magazine, August 89 issue:

CAE Training Not to Be Spoon-Fed

In reference to your June 1989 editorial about the lack of CAE for RF power amplifiers, I'm tickled pink that at least one area of RF design cannot be canned and spoon-fed to college students and graduates. Many [students] choose engineering for the dollar rather that the desire to create new things and get their hands dirty along the way.

[author's name not excerpted]
Ft. Walton Beach, Fla.

Atheletics 10, Academics 0

Your recent profile on Dick Anderson of HP points out the lack of motivation in American youth for science and methematics. The blame rests as much on the media, the local newspapers and TV. They, especially the former, consistently cover the scholastic sports activities of the local schools at least on a weekly basis and provide interesting features on the atheletes and their coaches. It is very difficult to find a similar report on the academic progress of our youth or their achievements in SAT or other academic subjects, the very basis for existenc of these schools.
Many industrial companies are ready to sponser athletics but rarely can one find a single one to sponser, say, the SAT preparatory classes for the students.
Is it any wonder that the outstanding students in the high schools feel ignored and sometimes ashamed of their talents and are concerned about their lack of competence in sports? Even colleges and universities are ready to shower athletic scholarships while merit scholarships are usually provided on a need-only basis. The same situation dominates the status of the teaching staff where the athletic coaches get recognition they deserve and the academic [staff] are more often ignored. Our youth will recognize the importance of science and mathematics if the press and the TV media do spend some of their talents on the progress of these academic fields in the industry and the institutions. The media must realize that the youth are the source of future scientists, engineers and doctors.

Just picked up an HW-8- something I've meant to do since I sold mine
to N8EVI many years ago.Does anyone have any mods, improvements, etc.,
that they can relate? I've seen a number for the HW-9, mostly having
to do with replacing diodes, but my library doesn't go far back enough for HW-mods.

In a related matter, I also picked up a Gonset 6 meter Sidewinder.
No doubt this is a risky endevor, as we have TV channel 2 in this
area, but I'm counting on cable. The previous owner installed a preamp,
which was a nice touch; I'm just curious to hear from any Sidewinder
owners who might have tips on the rig, or 6 meter tips in general (yes,
I printed and archived the interestist 6 meter article that ran here
a few weeks bavk).

I believe that your argument is extreme.

My old repeater transmitted a single code character in the
event of a reverse patch request, and further connection required the
response of a control operator. I don't think this violated the
spirit of the FCC's prohibition against non-hams transmitting.

In addition, the reverse patch required a three digit code
just to broadcast the request beep, and moreover, the whole reverse
patch function could be disabled if needed.

These are both potentially significant ESD hazards.
Additionally, it's possible a nearby electric cord could induce a
voltage on the iron.

Ground the sucker! Make sure you are grounded also, preferably
through a large (1M-ohm) resistor. Note that earth ground is not
required, only local circuit ground---Just make sure all your grounds
are the same.

Regarding car batteries kept indoors -
The danger is not only confined to smokers.
As the battery charges, it gives off hydrogen gas.
True, the gas could accumulate and present an
explosion hazard - to anyone - but there is something else
to consider. Hydrogen is terribly corrosive to many metals.
Keeping a hydrogen generator indoors is very destructive
to any metallic objects in the same room although it may
take several months to be noticable.

I don't know the exact frequency range of Voyager2's signal, but I know,(I believe), that the Engineers had to devise an, as of that time unheard of, frequency that would survive the long haul back to Earth and not scatter thousands of miles in all directions as it was transmitted.
Unfortunately, V2 was a troubled little ship from the start. One of the worst problems being that the primary transmitter failed. Of course, a backup transmitter was operating but at only minimal performance. With this going on, NASA co-ordinators on the ground had to scramble to install a command link to the spacecraft in case it decided to go altogether; this command package is always there in case the backup transmitter fails, to execute the necessary maneuvers on schedule.

Given the recent nostalgia (active and otherwise) for the tube gear of
1950 to 1970, I wish some enterprise would put out an old ham radio calendar.

As most of you have probably noticed, special interest calendars have come out
lately with everything from steam trains to aircraft to sports cars. I
currently have in my office one called "Radios, the Golden Age", which has a
nice glossy 10" by 14" color photo of some stylish 5-tube "all-American" AM
broadcast receiver from the forties or fifties above each month's calendar.
(Unfortunately, I took it down for this month - the 1950 Arvin "Hopalong
Cassidy" model, with "lariatenna" is just too silly.)

If someone would make such a calendar with great ham gear of the past, they
would find no shortage of candidates. Collins, Hallicrafters, the National
HRO-500, the Johnsons, the Hammarlund HQs, Heath, Drake, you know what I mean.
I'd pay $15 or $20 for one that I could hang in my office all year. It might
make a good fundraiser for some needy cause (like ARRL!?).

Dear fellow netters,
I am considering buying the Radio Shack Pro -34 scanner.
Does anyone have any experience with this portable scanner. Is this unit worth the price? Can anyone suggest a alternative either portable or base. Also, the Pro-34 is a 800mhz machine and the slaesman said that you can monitor cellular telephone calls, is this true and how is this done? Thanks in advance. please post to the net.

Thank you,
Tony Peasant

2216. Longer battery life for the Regency MX-4200/MX-4000

Newsgroup: rec.ham-radio
Date: 1989-08-18 19:16:57 UTC
From: parnass@cbnewsc.ATT.COM
Message-ID: <2544@cbnewsc.ATT.COM>
Source record: 17290

x
GET LONGER BATTERY LIFE FROM YOUR
REGENCY MX-4000 OR MX-4200 SCANNER

by Bob Parnass, AJ9S

The discontinued Regency MX-4000 and MX-4200 are battery operated, 20 channel scanners manufactured in Japan by AOR. Both scanners contain a low battery warning circuit which disables the scanner when the battery voltage falls below a preset level.

A freshly charged battery pack should last at least 5 hours before needing a recharge. Ron Smithberg, of Joliet, IL, complained of getting only 2 hours use from a set of freshly charged NiCd batteries in his MX-4200. This article describes how we increased his usage to over 7 hours between charges.

Both MX models are powered by a pack of 4 AA sized NiCd batteries. The battery pack is nominally 4.8 volts and has a rated capacity of about 500 mAh. The scanner draws about 100 mA when squelched. A good rule of thumb is that a NiCd should be recharged when its voltage falls below 1.0 volts per cell. Using this heuristic, the MX-4200 battery pack should be recharged when it falls below 4.0 volts under load.

The low battery circuit on Ron's MX-4200 was misadjusted to shut down the scanner prematurely when the battery voltage fell below 4.7 volts. I readjusted the low battery threshhold to 4.0 volts.

You can use the same procedure, but you will need the following equipment:

o An adjustable, regulated DC power supply, capable of furnishing between 3 and 5 volts at 500 mA or more.

o An accurate means of measuring voltage from the power supply. A digital voltmeter with an accuracy of 5% or better is preferred.

o A #1 Phillips screwdriver.

o A Small, slotted screwdriver or alignment tool.

The low battery sensor threshhold is controlled by a potentiometer. Here's how to readjust the sensor to 4.0 volts:

1. Turn the scanner off.
2. Connect a digital voltmeter to a well regulated DC power supply and adjust the supply to 5.0 volts.
3. Connect the power supply to the snap terminals on the scanner that would normally connect to the battery pack. Be sure to observe proper polarity. Connect the positive lead of the supply to the female snap, and the negative lead to the male snap.
4. Turn the scanner on.
5. As you watch the scanner's LCD display, gradually reduce the power supply voltage until the scanner's low voltage warning begins to flash.
6. Read the digital voltmeter. If it reads between 3.9 and 4.0 volts, no further adjustment is required, just disconnect the supply and reconnect the battery pack.
7. Otherwise, turn off and disconnect the power supply, and continue.
8. Turn the scanner upside down, and place it on a soft cloth so as not to scratch the case.
9. Remove the bottom tilt foot from the scanner.
10. Remove the battery pack.
11. Remove the 4 Phillips screws holding the case bottom, then remove the case bottom.
12. Reconnect the power supply to the scanner and set it to 4.0 volts.
13. Turn the scanner on.
14. Locate a small gray potentiometer on the printed circuit board. The potentiometer looks something like a gray plastic Phillips screw head. If the scanner front panel is facing you, the pot will be just behind the keyboard on the left side. (Don't confuse this pot with the 3 pots along the right edge of the board. The battery voltage sensor pot is not near any other pot.)
15. Slowly adjust the potentiometer to the threshhold at which the low battery indicator begins to flash.

This procedure worked with great success on an MX-4200, and its battery life was increased from 2 to 7.5 hours.

I would like to thank Rick Meyer, WB9UFL, for finding the potentiometer in his MX-4000, and Ron Smithberg for letting me experiment with his MX-4200.

:> scattered around the earth have ?
:
:Ah.. finally a question I can answer. First my credentials :
:
:I work in the telecommunications dept. of JPL. Our section handles all aspects
:of the DSN (deep space network.) In fact I was at Goldstone (one our stations)
:just last month.

My credentials, ten years in the DSN as a System Cog. Operations
Engineer. What follow are minor nits.

:
:Anyway, our DSN is configured to operation on S and X band. We have at least
:3 antennas at each site. One 70 meter antenna, one 34 meter and the other
:is 34 meter (used to be 25). We do have other antennas but they are often
^^ they were 26 meters

:
:Currently Voyager's signals are about -150 dBm. I don't know the exact value
:in watts but it's less than 1x10e-15 watts. Our total receiver system noise

about 1X10e-23 watts

:is approx 10 Kelvin. Most of it is contributed by the electronics after the
^^ total system noise temperature at X band ~23 degrees

:masers. Our masers (not my specialty) are cyrogenically cooled by nitrogen and
liquid helium

:exibit a total noise temperature of about 2-3 Kelvin (you can convert all these
:
:I'm not in the antenna group so I can't really say right now what the gain of
:each antenna is, but I could find out. Suffice to say that when the 70 meter
:antenna was upgraded from 64 meters, the additional 6 meters in diameter
:provided a 2 dB improvement in SNR, which is a helluava lot when working with
:low signal levels.

The gain of the 64 Meter dish was 63 dB, so it is now 65dB.

:
:Cliff Yamamoto de KA6JRG

I don't know what precise frequencies you use but a 70 Meter antenna
with 75% aperture efficiency (if you work that hard on upgrading the size
I bet you have some fancy feeds too) comes out on my calculator as:

2.0 GHz 61.8 dBi
10 GHz 75.7 dBi

Assuming the surface is good which it no doubt is. That's about 35 dB more
antenna gain than I have on 10368 MHz.... Sure would be fun to point it
at the moon with a few hundred milliwatts of transmit power.

2219. Broad education (long)

Newsgroup: rec.ham-radio
Date: 1989-08-18 23:43:48 UTC
From: MEHARP01@ULKYVM.BITNET
Message-ID: <8908190703.AA05590@ucbvax.Berkeley.EDU>
Source record: 17295

I told myself I was going to stay out of this one, but.....

This conversation about broad education really hits a sore spot with me. I side with the folks who believe in motivation, mostly. I would, however, like to submit another suggestion. Perhaps learning, like any endeavor, is an acquired skill.

My case is a classic example. I went to high school in what could politely be called an "inner-city school with a diverse socio-economic mix." What it really was was a hot kid factory in the first throes of court-ordered desegregation. They were worried more about people not shooting one another (or worse, them) to worry too much about an introverted kid who carried a Digital TOPS-10 Monitor Calls manual around with him all the time. I wasn't really very mainstream and didn't participate in class. The administration took no time to examine a kid who scored better than the class valedictorian on the ACT but had a 2.6 overall GPA.

The simple truth was that I didn't know HOW to study. I knew how to read a manual and learn about computers. No one ever taught me how to take notes, how to listen to lectures, or worst of all, how to take an exam. Worse yet, they didn't care if I learned or not.

College was worse. I was admitted to Engineering school on the virtue of my ACT scores. Unfortunately, through someone's mistake, I was placed in entry-level engineering calculus without having had a trig course and only having a C average in Math. Those of you who are engineers can appreciate the debacle that followed.

To make a long story short, I ended up getting very frustrated and quitting school for three years. I took a job with a bank, started my career in DP and the rest is history. The funny part is that the University was also the place that gave me a chance to excel WITHOUT a degree. They have promoted me from second-shift operator to Systems Programmer in just over five years. I was also readmitted to the University as a part-time student. I am progressing steadily toward my undergraduate degree. The best part is that I even enjoy school now. The reason is that someone at the University helped me find my place in it and helped get around the deficiencies of high school. That is what a University is about: opportunity.

My point is that education is only as valuable as you let it be. If you really don't care any more about being an EE than to let yourself get through five years of school without learning to solder, then that is YOUR problem. Don't tell me that the lab didn't have any soldering irons or that it wasn't in the syllabus to learn to solder. By the time

you make it to your Junior or Senior year, you are supposed to have enough motivation to pick up an iron and learn. I would also think that it would be fairly obvious that learning to solder might be a good idea. I think you should also re-examine the quality of an EE program that doesn't teach a student to solder. They do teach that here, i'm certain.

As for liberal studies, I can only say that we definitely need to do something about basic literacy in this country. We have people who cannot write complete sentences holding Master's degrees. I think the fundamental problem there is a lack of caring on the part of the entire system, both student and teacher. Should it not bother the student that he doesn't know how to make a sentence? Should it not bother educators that a person can make it out of the system without having learned this? Of course it should.

On the other hand, we have the absolutely astonishing costs of higher education. Parents are spending thousands upon thousands of dollars to give kids the chance at education. Other students bear the burden themselves in the form of student loans and work study. In return, the parents and the students do demand a certain course load that reflects their aspirations. Colleges, being service oriented institutions that compete in a marketplace, have to adapt to these demands if they are to survive. Therefore, we cannot place all the blame at the feet of the institution. The consumer creates the demand that drives the institution. If society is willing to tolerate illiteracy, then it is really society who is to blame when general literacy declines.

I don't know what the answer to this dilemma is. I do know that merely completing a degree program is not the total solution to education. Education is a continuous process that the person being educated has to continue on his own. Universities can only provide the opportunity, the rest is up to you.

You can always go to the library and read a classic if you really want to.

2220. Dual-band mobile recommendations

Newsgroup: rec.ham-radio
Date: 1989-08-19 01:08:20 UTC
From: KENDALLG@VTVM1.CC.VT.EDU
Message-ID: <8908190703.AA05606@ucbvax.Berkeley.EDU>
Source record: 17296

I need some advice - after 2+ years of inactivity in ham radio I've been bitten by the bug again (yea!) I've still got my Kenwood TR2600-A 2m HT but now I'm looking at buying a dual-band (2m/440) mobile.

I'm tempted by Kenwood's model (TM721-A i think) - among other things I like the dual freq. displays... I've also read about some mods that will enable the rig to work as a cross-band "repeater" of sorts, which sounds very tempting if I could use my 2m HT in the house to work 440 through my rig in the car.

Icom's mobile doesn't have dual displays, and the only Yaesu mobile I've seen has the remote control head (more $$$) which I can do without. Any suggestions and/or directions to recent archives here with such info will be greatly appreciated.

Thanks much!

(comments about problem with TR4 deleted)

Anyone having a problem with Drake gear should consider investing in a telephone call to R.L. Drake Company of Miamisburg, Ohio. Call them at 513-866-3211. They are very helpful, and you can talk to a tech that is an expert on your old rig. They can also service all of their old gear, and that might be nice just to get all the engineering mods done and have it factory aligned. I have used their advice when working on my TR7, and they are great. If you describe a problem, they have seen it before and can tell you just where to look.

2222. Spread Spectrum data link

Newsgroup: rec.ham-radio
Date: 1989-08-19 17:42:51 UTC
From: buaas@TROUT.NOSC.MIL
Message-ID: <8908191742.AA15139@trout.nosc.mil>
Source record: 17294

In Edition #578, Steve Roberts wrote about the Hillier Technologies Spreadex 902-928 MHz 66kb data system. Their initial market is to support wireless communications for intrusion detection systems, providing connectivity between the sensors and the central control unit. It is designed to transmit very short bursts, nominally 32-bit messages consisting of sensor device address and value reading.

Six months ago I inquired about the system, to find out the following additional information: the system demodulates BEFORE it despreads. The result is twofold. (a) The system provides no "processing gain" which properly designed SS system give in the ratio of the spread signal bandwidth divided by the information bandwidth (e.g., a 26 khz-wide signal spread over 26 Mhz gives a 30 dB processing gain). (b) any strong narrowband signal in the near-field of the receiver is likely to render the system ineffective due to usual desense/ mixer intermod problems. Building a full-duplex system in the same spectrum using this methodology would be quite difficult, having to resort to time-domain multiplex to accomplish the pseudo duplex.

Consider the longterm spectrum contamination problems: the system is radiating ~30 dB more signal than required to accomplish the short-range communication. Put another way, 1000 stations could share the same spectrum effectively if the receiver despread before it demodulated. If you were wanting to talk a few hundred feet, wouldn't you use a few milliwatts? A watt goes a long distance at these frequencies. I'm talking 30-miles!

This methodology may implement the requirements of Part-15 for new unlicensed devices, but it certainly does not meet the Amateur requirement to use minimum power. Very many of these units will make a hash of the 902-928 ham band in short odrer. In the interest of low cost, Good Engineering Practice gets sacrificed.

PS: I know of another company which is working on a properly-designed system, but I can't talk about it yet. I've made a list of interested parties to contact when the product is ready for test. Mail to me directly if you want to have your name added.

2223. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-08-20 04:52:03 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8908200707.AA07517@ucbvax.Berkeley.EDU>
Source record: 17297

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

2224. Ham HyperCard Stack access via FTP

Newsgroup: rec.ham-radio
Date: 1989-08-21 11:58:31 UTC
From: dls@genrad.com
Message-ID: <25055@genrad.UUCP>
Source record: 17300

As I promised you, there is now a method of obtaining the Novice Ham Test
and Technician Ham Test HyperCard Stacks via your very own computer.
Here are the directions which I received from the person who is providing
this service (Peter Hayward):

The two Hyper-Card stacks are now available via
anonymous FTP at tank.uchicago.edu. In my expermenting the past couple
of days, downloading in binary mode produces a useable stack. Unbinhex
with binhex 5 or MacBinary, then unstuffit.

The names of the two stacks are:
HamNovice.sit.bin
HamTech.sit.bin
in the directory /pub/public.

Thank, Peter!

For others who don't have access to this FTP feed, there are still plenty
of diskettes which I will give away. My good ham radio friend supplied me
with 7 BOXES (70 diskettes), so I'll continue to give away the stacks
to anyone who asks for them. PLEASE REMEMBER TO SEND YOUR MAILING ADDRESS.
I'm not omniscient, so I can't figure it out on my own....although I do
now have the Call Books, so if I had the call sign, I could probably look
it up.

I've started typing in the General Test questions....that should be ready
in the near future.

That's all for now.

Cheers!

Subject: Suggestions/Advice needed on a Tech/General Upgrade Course

I am coordinating and helping to teach a course sponsored by my club this fall to help folks upgrade their license to either Technician or General Class.

I have some ideas about the curriculum for this course, but I'd like to get some suggestions and advice from the collective wisdom of the net. I'd appreciate hearing from folks who have taught classes, or folks who have been in classes and have some opinions on any of the following questions:

0) What is the best way to advertise the class?

1) What seems to be the right length for the course? 8 to 10 weeks, one evening a week for 2 to 2.5 hours?

2) What should be the split of class time between theory and code?

6) What is the most effective method for having folks increase their code speed?

3) What are some of the best in-class exercises for practicing theory and code?

4) What types of quizzes or tests should be given, and how often and when?

5) What are the best out-of-class exercises for working on the theory and the code? Should there be regular homework?

6) Based on your prior experiences with ham license classes, what things should be avoided in the class?

7) What things would make a class better, based on your prior experiences with ham theory and code classes?

I appreciate any and all responses, and will post results to the net.

2227. pizza wars

Newsgroup: rec.ham-radio
Date: 1989-08-22 13:41:16 UTC
From: rachiele@NADC.ARPA
Message-ID: <8908221341.AA08466@NADC.ARPA>
Source record: 17301

There is one time when it is legal to use an autopatch to order a pizza. If you haven't eaten in 6 weeks, and just managed to row your raft to within radio distance of shore, then it would be perfectly legal to order food, to prevent starvation. This falls into the category of emergency business communications.:-)

Subject: HAM Auto License Plates

(This is a repost as promised -- more responses invited !! -- N1EYZ)

I'm collecting information about policies regarding special Auto License plates for Amateur Radio Operators. I'm interested in getting information from all 50 States and all Canadian Provinces, and also from as many other areas of the world that can respond.

I'd appreciate at least one response from each area, so if you are willing to fill in the following questionaire with the most accurate information you can get and return it via E-mail (or USPS), you will receive credit when I summarize the results and post to the net (and possibly contribute an article to QST or 73, etc.) This may be interesting information for many purposes, including figuring ways to get better publicity for Amateur Radio. I'll periodically let the net know what areas have not yet responded, so that we can do a "WAS" quickly and efficiently!

Please feel free to edit the form of the questionaire to provide yourself with more room to answer the questions if you need.

Thanks,

Roger Tobin, N1EYZ

==========Cut Here==========

Your State, Province or locale: _____

Does your State (or locale) have special automobile License Plates for Amateur Radio operators (also known as "Ham Plates")? Yes: _ No: _

Are these Ham Plates considered the same as other "vanity" plates:
By the registration authorities? Yes: _ No: _
By the law enforcement authorities? Yes: _ No: _

Excluding sales, luxury or excise taxes, what is the initial registration fee or charge for:

Ham Plates? _____
Other Vanity Plates? _____
Regular Plates? _____

How much is the renewal fee for:
Ham Plates? _____
Other Vanity Plates? _____
Regular Plates? _____

How long (the length of time between renewals) are the plates valid?
Ham Plates: _____
Other Vanity Plates: _____
Regular Plates: _____

How is renewal handled for these kinds of plates?
Ham Plates: Sticker: _ New Plate: _
Other Vanity Plates: Sticker: _ New Plate: _
Regular Plates: Sticker: _ New Plate: _

Can Ham Plates be used on any type of vehicle other than a standard Passenger Car (such as a light truck)? Yes: _ No: _

Can you get Ham Plates for other types of vehicles like Motorcycles, RV's, or Boat Trailers? Yes: _ No: _
If yes, what types of vehicles? _____

Do Ham Plates have border wording that indicate it is a plate for Amateur Radio? Yes: _ No: _

Do Ham Plates include any special symbol in the plate number (like a thunderbolt) different than that used on Regular plates? Yes: _ No: _
If yes, where is it placed in the call? _____

Do Ham Plates use the same colors as Regular plates? Yes: _ No: _
If no, what are the differences? _____

What proof does your local registration authority require in order for an applicant to get Ham Plates? _____
Is there any proof required to renew a Ham Plate? Yes: _ No: _

How long does it take to get Ham Plates? _____

In your area, where are license plates displayed on a vehicle?
Ham Plates: Front: _ Rear: _ Both: _
Other Vanity Plates: Front: _ Rear: _ Both: _
Regular Plates: Front: _ Rear: _ Both: _

What, if any, extra rights are legally allowed (like double parking for Doctors with MD plates) in your area by having Ham Plates?
_____

Does your area have other "special" license plates that are available to certain groups (like Veterans, Ex-pow's, CAP members, etc.) at a cost different from that of a Regular Plate? Yes: _ No: _

If yes, please list the categories and costs, if you know them:

_____

Are automobile insurance rates different for vehicles with Ham Plates
or other types of non-standard plates? Yes: _ No: _

Have you confirmed the above information with local Motor Vehicle
Registration or Law Enforcement authorities?
_ Yes, I called them up and confirmed it.
_ Yes, I asked someone who works there.
_ No, but I have the local rules right here in front of me.
_ No, I just wrote down what I remembered.
_ No, I asked someone else.
_ No, I'm just guessing. (in which case, please DON'T reply!)

Are you a Licensed Amateur Radio Operator? Yes: _ No: _
Do you have Ham Plates on your vehicle? Yes: _ No: _

Do you think Ham Plates are a good idea? Yes: _ No: _
Why (please elaborate)? _____

Might any of the information above change because local authorities
are considering changing the motor vehicle licensing laws to address
some political or financial problem? If so, please elaborate:

_____

Name: _____ Call: _____
I can be reached at: _____

Thanks for your help in gathering this information -- de N1EYZ

2230. Optonica turntable

Newsgroup: rec.ham-radio
Date: 1989-08-22 14:30:17 UTC
From: iws@rayssdb.ray.com
Message-ID: <2553@rayssdb.ray.com>
Source record: 17304
Cross-posted to: rec.audio,sci.electronics,rec.ham-radio

I recently got a turntable, about which I would like a little info:

Optonica Model No. 1414 MK II
33/45 speed - belt drive - automatic turntable
made by Sharp Electronics

Any ideas on when these were made?
Is this a good quality turntable?
What type of cartridge should I use in it?
Does anyone have instructions on how to adjust the
weights - tracking force and (I assume) anti-skating?
Anyone still have a manual which they could photocopy
and USMail or email the instructions?

Thanks for your help - Ihor

2231. YAESU FT767GX mod

Newsgroup: rec.ham-radio
Date: 1989-08-22 14:42:58 UTC
From: Kendell_Chilton@dgc.mceo.dg.COM
Message-ID: <8908221542.AA00047@adam.DG.COM>
Source record: 17305

CEO document contents:
I have recently purchased the aforementioned transceiver. I have had no problems to speak of and enjoy the rig thoroughly. I would like to submit the following mod for the rig. Note that implementation on this mod is at the rig owner's risk and may violate warranties. Here is a description of the mod:

o Remove the bottom cover (8 screws: 4 underneath, 2 on each side)
o Remove the plastic rear panel. (Just a cosmetic piece)
o Remove the rear metal panel. (So many screws)
o Loosen the "hinge" screws on the front bottom. There are 4 of them.
o Lift the now loose card tray to expose to inner circuit boards. Be careful! There are two power supply lines that need to be disconnected. (Remember to reconnect them on assembly.) (one is the control board, the other the one we want.) Note that the board we will mod is the same one that has the switch that allows changing the tuning dial from 5kHz/rev to 10kHz/rev.
o Change the position of switch S01. The rig will now transmit from 1.5 to 29.99999 MHz.
o Reverse the disassembly procedure.

Well that's it. You are now ready for any band addition that may come our way. If you have problems, reply; I'll try to answer your questions.

```
-------
I was at a recent, informal gathering of local (S. Calif) DXers at
which it was mentioned that the sun might be in turmoil (i.e. good
DX conditions) for the next 10 years or so. Specifically, a
Scientific American article was "quoted" as saying the current
thinking is that there will be no sunspot minimum per se in the
90s since the sun is changing magnetic poles and will be "upset"
for quite a while. Anyone have more info on this? Or was the
source of this info (our local HRO store manager) trying to
encourage sales?? (Hi)

From: fisher@minster.york.ac.UK
Message-ID: <swordfish.619821933@minster.york.ac.uk>
Source record: 17308

Digital equipment, including computers, radiates "hash" which interferes with radio reception. I had to tackle this problem recently, and, although I solved it (this time!), the following thoughts occurred to me.

The spectrum of RF noise emitted by a computer depends on the program it's running. There will always be radiation at the clock frequency, and most often at all harmonics of the clock frequency, with the radiated power decreasing the higher up you go. Furthermore, if a loop in the program takes time t to execute, there will be radiated power at harmonics of 1/t.

It's possible to write a compiler which optimizes code according to given criteria; e.g. smallest code size, smallest data size, or (most commonly) fastest execution. Now, suppose I want to minimize emissions at a given frequency. Might it be possible to write a compiler which optimizes the code it generates to minimize radiated power at that frequency? How might one go about writing such a compiler?

The Drake TR-4 a boat anchor???? NEVER!!!!!!

I have owned a Drake TR-4 radio for the past 8 years, and to this day, my only problem has been with 1 tube going bad. What about drift? There is not any. Put a Sure 444 microphone with the TR-4, and you have, in my opinion, one of the "best" used radios available. If you want lots of knobs, lots of filters, receivers so sensitive that the noise is S-8 all the time, and finals that burn out when you even consider running your 20 year old coax to your favorite barbed wire fence, then this radio is not for you.

Talking about their service department, there is always someone available that is familiar with this type of radio, they have spare parts (don't forget to get a spare "antenna fuse" - a little light bulb that you don't know about until it is too late), and will recondition the radio for a modest fee.

Now, if you want to operate mobile, then that is another story.....

Source record: 17311

I've heard mention of the new Ten-Tec Argonaut, but there's been nothing in the US Ham press. However...the July Radio Communications (official publication of the RSGB) has an intersting article on the rig.

Seems Ten-Tec will be producing the Argonaut 535, a 5 watt PLL synthesized rig with CW, SSB, optional FM and AM recieve sometime this fall. The front panel mockup looks much like a shrunken Paragon. Alongside this rig will be produced a new Argosy, the same rig as the argonaut with a 100W final. Prices are expected to be $900 for the Argonaut and $1100 for the Argosy.

Imagine- a US made rig that sucessfully price competes with the cheapest of the imports- and with Ten-Tec service and support, easily the best in the industry. Almost makes me want to sell my TS-140S.

Interestingly, two discontinued Ten-Tec rigs, the Century (my first real rig) and the original Argosy are still available in GB, being made there under license. I wonder what it would cost me to import one...? :)

OOPS!!!

I forgot some important information (or didn't have it) in my previous calculations. Although I can add and subtract dBs (no flames please) I neglected to add in the spacecraft transmitter power and antenna gain. Also, the path loss was unknown and I was too lazy to figure it out. Anyway, a subsequent poster has provided that info, so now I agree with the -150dBm estimate of signal strength. Interesting- I was also wrong about the 1Hz BW- I thought the ground stns were listening that way, but it's the Voyager that is operating in this narrow bandwidth. It seemed strange to me that we could get meaningful data at any kind of rate in a bandwidth that narrow.

Oh well. So much for my attempt to figure out signal strength. BTW- the poster who provided the rest of the equation (sorry, I forgot to note who) also indicated that he felt a -5dB SNR was pretty poor. I agree, except that I heard these type of ratios were easily providing useable info when fancy DSP systems were involved. Is this the case with Voyager? Or are we again miscalculating and the resultant signal strength is much higher than the numbers we show? Comments are welcome.

With head hung in shame at my poor calculations :^(

2240. Microwave Questions

Newsgroup: rec.ham-radio
Date: 1989-08-23 14:34:00 UTC
From: U009@CCIW.BITNET
Message-ID: <89Aug23.134048edt.57355@ugw.utcs.utoronto.ca>
Source record: 17314

---

recently Michael_Edelman%Wayne-MTS@um.cc.umich.edu asked some
"Microwave Questions" and I replied directly. I then thought
others on the net might find what little I had to say useful.
I will be watching for other stuff for myself too!

>1. The current source (no pun) of Gunnplexers, or similar devices?

You will find A.R.R. (who advertize in QST) ca supply real Gunnplexer
stuff (made by MA-Comm (?)) including bare cavity stuff for 10 and
24 GHz, and controllers with AFC and all the goodies. Kind of
expensive (2M mobile rig price) or you can get a SOLFAN microwave
intrusion detector from the local burglar alarm company if they
have removed any lately (call around a lot. talk to the stock
clerk or the installers themselves.). We bought a bunch for $5.00
ea (CDN) some of which still contained OK Gel-Cells. Then you
can build up the electronics (pretty simple stuff. we use a
1 chip FM radio (TDA7000 by Signetics - $2.50 ea) and a few
components for the 30 MHz wideband FM receiver. optional
30 MHz preamp (MRF901 type) desireable. Modulation on the
Gunn from a LM317 adjustable voltage regulator (VE3ITU used
one to send 6 MHz Video!!))
Or if you are not all thumbs at metal work, you can roll
your own from surplus (Flea market) X-band plumbing.
Send for further information.

>2. The best periodicals for microwave info (I get QRX)?

Haven't found commonly available ones. 73 has published a few
articles over the last 36 months. Most useful information comes
from VHF Communications which I used to subscribe to. It is a
translation of a German publication and I think it still exists.
There is even a US Distributor but I lost track of them as they
changed around. (note to net: someone must know!)
Ham Radio had a few articles by Glenn Elmore (sp)
and some older stuff, as well as an on-going column by W1JR about
VHF/UHF stuff, many of which dealt with antennas, plumbing,
components, and propagation. (Except the column seems to have
stopped lately.) If you can find the old issues at a
flea market, I suggest you get them. If you want I can give you
a list (photocopy by mail) or you can check out the annual index
at the local library if they carry it.

>3. The best reference books? (I have the RSGB VHF/UHF manual).

RSGB is good. I think proceedings of the various Microwave and VHF/UHF conferences are great if you can locate them. I was also figuring on asking the North Texas Microwave Society (alluded to lately with the demise of the New Frontier column in QST) if they had back issues available or a "Best of..." type publication.

Someone on the net might permit you to look at or photocopy his collection even.

By the way, I am part of a loose group around London/Kitchener/ Burlington/Toronto who are doing some stuff on 10 GHz now for the contest. If you can reach us on 2M sideband, try at 20:00 and 21:00 EDT and look for VE3MWM, VE3SMA, VE3EZP, VE3LPP, VE3WCB, VE3RKS, and others. We would be happy to talk to you and help you get going, particularly if you might be interested in trying some contacts across the border (even up the west side of Lake Huron).

Regards, Stu Beal, VE3MWM, (U009@CCIW.BITNET),
National Water Research Institute,
Burlington, Ontario, Canada.

>
> 2. The best periodicals for microwave info (I get QRX)?
>
> 3. The best reference books? (I have the RSGB VHF/UHF manual).
> 73
> Michael Edelman Bitnet: medelman@waynest1
> Wayne State University UUCP: umix!wayne-mts!Michael_Edelman
> 5925 Woodward Internet: Michael_Edelman@um.cc.umich.edu
> Detroit, MI 48202 ARS: KE8YY
> fax: 1-313-577-5626 Landline: 1-313-577-0742

There are lots of sources of Gunn units- if you want to pay
the big bux, ARR (Advanced Receiver Research) makes a
complete transceiver unit. They will also sell just the
Gunnplexers. See their ads in the ham mags for an address and
phone #. Also, many of the alarm companies are scrapping
X-band Doppler alarm units, so you might contact the ones
in your area- they may give you a pair (or sell 'em cheap).

The best periodicals for microwave info would have to include
the Newsletter of the North Texas Microwave Society (contact
WA5TKU or WB5LUA for info- both are okay in the Callbook). Also,
to a lesser extent because he prints what he gets, is VHF/UHF
and ABOVE, published monthly by Rusty, KA0HPK (also okay in
callbook). VHF Communications and DUBUS (both from Europe)
are great in their own way, but are expensive (in the U.S.)
and the DUBUS magazines are in German (I think that's still
the case, unless they are now offering translations).

The best reference books would have to include the UHF
Compendium, Volumes 1&2, 3&4 (published that way, as two books)
from the Germans who do DUBUS- these are translations of
selected DUBUS articles. About $60 for the set, through
Ham Radio. Also, ALL of the ARRL-published Proceedings of
the Central States VHF Society (1987- present) and
Proceedings of Microwave Update (also 1987- present). Believe
it or not, the RSGB VHF/UHF Handbook is considered the
bible, though much of the information is dated. Too bad the
ARRL Microwave Handbook has been put on the back burner (AGAIN)-
by the time they publish it (if ever), the info will be more
out of date that the stuff in the RSGB Microwave Newsletter

Technical Collection (which is old, but still largely useable).

Hope this helps.

2243. Re: deep space dishes

Newsgroup: rec.ham-radio
Date: 1989-08-23 17:09:30 UTC
From: cramer@optilink.UUCP
Message-ID: <2178@optilink.UUCP>
Source record: 17317
Cross-posted to: rec.ham-radio,sci.space

In article <313@magic.UUCP>, jam@magic.UUCP (James A. Markevitch) writes:
> Let's see... from some computations I did a few years ago the power for
Voyager's signal is as follows:
#
22W transmitter @ 8.5GHz 43 dBm
3.7m parabolic antenna 55% efficient 38 dBi
free space path loss (29.6 AU) -303 dB
70m antenna gain 73 dBi

-149 dBm
#
15 degree K receiver -187 dBm/Hz
#
S/N 38 dB/Hz
#
I can't remember, offhand, what the data rate from Voyager is, but 20kHz
comes to mind, so:
#
BW 20kHz -43 dB
#
S/N for a single 70m antenna -5 dB
#
This sounds a little low, even given the arrays being used so maybe the
data rate is lower or there is a little slop in some of the above
numbers.
#
Jamie

The data rate is wrong, I think. My copy of _Mariner_Jupiter_Saturn_
77_Mission_Test_And_Telemetry_System_Software_Planning_Document_
(before they changed the name to Voyager) dated May 18, 1976, shows:

Three high rate streams:

one at 57.6 KBPS, &
two at 1200 BPS, &
ESP input at 16 BPS.

One low rate stream at 40 bps, &
two high rate streams:

one at 57.6 KBPS, &
one at 67.2 KBPS, &
ESP input at 16 bps.

My vague recollection was that the 1200 bps stream was engineering
and general science data, and the 57.6 kbps stream was general science
and imaging data. (Everything was mixed together in the most peculiar
arrangements, which required software to separate the various types
of data out -- which is what I did -- badly -- on that project).

You can hear -150dBm? How much noise is contributed by the rest of your system?

I'm quite sure of the values I posted. But to make sure I called my COE who just recently received some reports from the overseas stations.

These measurements were taken at Madrid, Spain approximately 3 days ago:
Voyager Predicts : -152 to -153 dBm
Blk III Rcvr AGC : -153 +/- 1 dB
PPM SLE : -154 dBm Constant

At Canberra we experienced a maximum system temperature of 45K and a minimum of 22K. An envelope of 45K at the extremes was caused by earth noise with the antenna at near horizon. 22K occurs with the antenna at near zenith (plus sky noise)

Note -153 dBm takes the suppressed carrier into consideration, which accounts for an additional -13 dBm.

I'd like to thank Lee for correcting my previous errors. I'm not sure of how he obtained 1X10e-23 watts, but I am certain of the dBm measurements we have.

The PPM SLE is our signal/system noise temp measurement subsystem. It stands for Precision Power Monitor. The SLE (Signal Level Estimator) works in conjunction with the NAR (Noise Adding Radiometer) at each antenna. By adding NBS tracable noise into the system (using noise diodes), we can calculate the system temperature using Y-Factor and the known added noise. Since we know the temperature, we can calculate SNR with the SLE. The SLE takes a 12.5 Hz portion of the receiver IF and performs a 256pt FFT on the spectrum. We assume the carrier is in the center (which can only occur with the receiver set to closed loop). Several SNR samples are averaged to obtain consistent results. The returned values are accurate to 0.2 dB.

Just so Lee knows where I fit in, I'm the CDE for the PPM. The COE is Joe Johnson.

The cheapest way to get on X-band is with a discarded radar burglar alarm or door opener. Large numbers of microwave intrusion detectors are currently being retired, having been replaced by passive infrared devices which have a lower false-alarm rate. Solfan is a prominent brand; several variations of 10-GHz transceivers can be found at hamfests for $1 - $20. The knowledgeable shopper can find many other cheap but useful microwave components at hamfests.

Throw away everything but the microwave assembly, connect a 9v alkaline battery to the Gunn diode. The devices operate near the police radar frequency (10.525 GHz) and can easily be tuned into the adjacent ham band. Besides conventional ham activities, they are useful as wireless portable perimeter-alarms: Equip the emitter with a trip-wire switch, use an ordinary radar detector as the receiver.

Mobile applications depend upon your imagination. :-)

From: mkg@lzsc.ATT.COM
Message-ID: <1174@lzsc.ATT.COM>
Source record: 17326

I'm getting back on the low bands and want to put up a multi-band antenna for 40-10m (including WARC). I realize the performance drawbacks of a multi-band antenna but space considerations force me to consider them.

The obvious choices are dipole-style antennas such as a G5RV or verticals such as a Cushcraft R5 or a Butternut HF6V.

I'd like to hear from owners of these (or similar) antennas so I can decide what will be planted in my back yard.

Thanks in advance.

>
I did not catch the official questionaire, but I live in ALabama
and just filed for a Ham plate on my new truck last week. The
extra cost is only $3.00 per year as opposed to the $50.00 annual
fee for a "vanity" plate. The reason given (I asked) for the price
break was three fold:

1) Amateur radio is perceived as a community resource...
2) Call signs are guaranteed unique.....
3) Tracible through a federal agency....

If this does not fully answer the questionaire, I would be happy
to elaborate.

Cruisin' with KM4JN plate,

Joe Herbster

2250. Old article on curing MX-5000 microprocessor RFI

Newsgroup: rec.ham-radio
Date: 1989-08-23 20:33:26 UTC
From: parnass@cbnewsc.ATT.COM
Message-ID: <2651@cbnewsc.ATT.COM>
Source record: 17325

x
I found at least one old article about the RFI problem
(microprocessor noise) in the Regency MX-5000 scanner.
It was entitled "Curing the RFI Problem in the Regency
MX-5000," written by Dave Buda, WA2RYC, and appeared in
8/84 Monitoring Times.

Portions of that article follow:

"As anyone who has used the new Regency MX-5000 knows,
there's a good amount of interference radiating from its
internal workings....The problem disappeared as soon as
an outside antenna was connected to the unit."

"...I decided to make a simple modification that proved
to be a great help in eliminating 95% of the radiation
problem."

"I contacted Miller-Stephenson" (Danbury, CT 06810) and
obtained a couple of cans of the RFI-conductive Coating
Spray. The MS-485 spays has an attenuation of 78 dB at 1
MHz and 44 dB at 1000 MHz with a surface resistivity of
2.9 ohms per square inch."

"The manufacturer recommends you apply several light
coats to obtain 1.5 to 2 mil coating."

"I removed the top and bottom covers and the front panel
as well. After carefully masking the outside of these
covers I proceeded to spray the inside of the covers and
panels with about 4 thin coats as recommended."

"The spray dries quickly so the whole modification
shouldn't take more than a half hour."

"When I replaced the covers, I simply added star lock
washers between the metal chassis and the outer covers.
This allowed for good contact to ground for the now-
shielded plastic case."

"The modification was a success. As soon as I turned
the unit on again, the RFI problem had disappeared. Bir-
dies were almost nonexistent and I was on my way to scan-
ning again..."

2251. Gooney Boxes and the American Way

Newsgroup: rec.ham-radio
Date: 1989-08-24 02:59:53 UTC
From: bruces@sco.COM
Message-ID: <5328@viscous.sco.COM>
Source record: 17321

I laughed so hard I almost snorted an antler
when mbutts@mentor.com (Mike Butts) said,
HA! From article <5208@viscous.sco.COM>, by bruces@sco.COM (Kid Marcom):
HA!
HA! The more serious operators in our neighborhood stepped up to a...
HA! >
HA! > * Gonset 2-meter (and/or 6-meter) transceiver (the grey classic -
HA! > six watts of AM, complete with handle, four crystals, noise
HA! > squelch you never used , all four megacyles [I mean, 4 *MHz*,
HA! > sorry...] of the band [on both 2 and 6] squeezed into a
HA! > two-inch dial, and a burgundy rcv/xmit lever switch that
HA! > could've come straight off a Dictaphone. The Civil Air
HA! > Patrol version was white, but nobody ever saw one.)
HA! You mean the Gooney Box! Ugly sucker, wasn't it. The ones I mostly
HA! saw were painted nuclear attack yellow with big CD logos stuck on.
HA!
////////////////

Hey, that's "Gonset COMMUNICATOR" to you, Mister! :-)

Yep, that's the Gooney Box, all right. I don't know about those
yellow CD versions, but like I said, no one (at least that I
knew) ever saw one up close and personal, so all I know is what I
saw in the B&W ads in "CQ" where they LOOKED white.

And actually, this is the original version we're talking about
here; there was a Gonset Communicator *II* released later, and -
along with some rounder corners and somewhat softer design - it
WAS white. But I don't recall that they ever caught on nearly as
well as the original Classic.

The Gonset was the rig - like your friends - that your parents
warned you about. At least the one who was concerned that
2-meter phone was the kiss of death for your expected Novice
dreams of 13 WPM, your General ticket, DXCC on 20, and in
general, the American Way of Life as we knew it. This type of
aberrant behavior was not to be further encouraged, since the
12-month clock on your irreplaceable Novice ticket was winding
down, and you had to engage in this time-critical CW rite of
passage known as "getting over the hump," instead of frittering
time away building such demonic add-on tools as front-end
pre-amps and 2-meter yagis to help you work guys 300 miles
away on a crisp, cold night with your six-watt Gooney Box.

2252. Voyager link calculations

Newsgroup: rec.ham-radio
Date: 1989-08-24 03:33:46 UTC
From: karn@ka9q.bellcore.com
Message-ID: <17463@bellcore.bellcore.com>
Source record: 17322
Cross-posted to: rec.ham-radio,sci.space

Here's another link calculation for Voyager 2 at Neptune. I got some more precise figures, and the result looks pretty reasonable. My references to "Yuen" are to the book "Deep Space Telecommunications Systems Engineering", edited by Joseph H. Yuen and published by Plenum (ISBN 0-306-41489-9).

8415 MHz transmitter power +11.04 dBW
(12.7 W - low power mode ref Yuen):
3.7 m spacecraft antenna gain
(ref Yuen p 4): +48.13 dB
EIRP: +59.17 dBW

Path loss, 4.416e9 km, 8415 MHz: 303.85 dB
= 20 log10(4*pi*d*f/c)

Receive signal flux: -244.68 dBW

70m receive antenna gain: +73.8 dB
= 10 log(4*pi*A/lambda^2) - N
lambda = C/8415e6 = 3.56cm
(assuming N = 2 dB illum loss)

Receive signal power: -170.88 dBW = 8.16e-18 W
= 8.16 attowatts
= 8.16 nano nano watts

Received energy per bit (Eb): -214.22 dBJ = 3.78e-22 J
at 21.6 kb/s (43.34 dB-b/s) = .000378 attojoules
= 0.378 piconanojoules

Receive noise density (N0): -218.60 dBW-Hz
= 10 log10(kT)
T = 10 Kelvin (ref USENET)

Eb/N0 ratio: 4.38 dB

This is quite consistent with the performance of the concatenated rate 1/2 Reed Solomon + rate 1/2 convolutional coder, which according to Yuen (p 255) has a very steep "wall" or threshold just below 3 dB.

However, this figure does not take into account miscellaneous losses (connectors, feedlines, etc) on board Voyager or at the receiving site, nor does it allow for atmospheric absorption or transmitter degradation below the nominal 12.7 watt figure.

According to an interview carried tonight on NASA select, the arraying of the VLA to Goldstone effectively doubles the aperture of the receiver, so this should give another 3 dB of margin to compensate for these factors.

As you can see, attention to detail is all-important here!

Phil

2253. Recomendations for mobile antenna

Newsgroup: rec.ham-radio
Date: 1989-08-24 07:50:00 UTC
From: STEVE$@S57.Prime.COM
Message-ID: <386400002@S57.Prime.COM>
Source record: 17328

I'm looking for recomendations on a good mobile antenna, for my
BC200-XLT scanner, that will cover 30Mhz through 956Mhz. I'm currently
using my Amateur band Larsen 2/70 with mixed results (great above
144Mhz but a lot to be desired below 144Mhz). Ideally I'd like to
make use of my Larsen PO-TLM (trunk mount with an SO-259 connector)
but I'm willing to try anything.

73's and happy monitoring,

arie@ee.su.oz.AU asks:

>I frequently travel to many countries and would like to stay in touch with home
>I would like the simplest design for a S.W. receiver that could receive one
>frequency under lets say 10 Mhz.

I saw a SW receiver kit (reviewed in recent 73's Magazine) for $24.95.

It covers 4 to 11 mhz., 1 uVolt sensitivity, runs on 9V. battery and
is varactor tuned. The article was generall favorable. Their main
complaint was, because it was varactor tuned, the tuned frequency wasn't
obvious (tuned with a pot.). This could be remedied with a previously
calibrated knob, using another receiver as a standard.

Their address is: Ramsey Electronics

Ah...

The nostalgia....

I obtained a box of 1940's QST Mags. from a friend a while back.

It's interesting to see the rigs mentioned in the previous responses
advertised in them. Believe it or not, Radio Shack even sold Amateur
Radio equipment, not the cr*p they sell to the unknowing public today.
They were once a Hammerlund delear.

It was interesting to see all of the U.S. manufacturers of radio equip.
(where did we go wrong?)

'Full page ads on capacitors and the like...
Those were the days (no, I don't consider myself an "old fart" yet).

My vote is for my first Novice rig (of course).

A Drake 2NT (complete with TR relay and variable power) and the
Hammerlund HQ 110. 'Paid about 200 bucks for the whole works and was
very solid equipment.

I just picked up another 2NT at a recent swap for 40 bucks. Now if
I could just find the 110....

Then there was the "old drifter", the EICO 753..... (gag, puke).

I'm looking to buy a 2m/440 dual band hand held in the near
future. I have to decide between the Icom 32at, Yeasu 470 and the
Kenwood TH75A. I find out that all the three radios have almost the
same features execept the Icom which does not have a dual display.

The Icom32at and the Yeasu 470 do have a cross band repeat
function built in (the Icom does it on simplex frequencies only).

Does any body know if the Kenwood75A does or does not work
as a cross band repeater.

:
: Three high rate streams:
:
: one at 57.6 KBPS, &
: two at 1200 BPS, &
: ESP input at 16 BPS.
:
: One low rate stream at 40 bps, &
: two high rate streams:
:
: one at 57.6 KBPS, &
: one at 67.2 KBPS, &
: ESP input at 16 bps.
:
:My vague recollection was that the 1200 bps stream was engineering
:and general science data, and the 57.6 kbps stream was general science
:and imaging data. (Everything was mixed together in the most peculiar
:arrangements, which required software to separate the various types
:of data out -- which is what I did -- badly -- on that project).
:
:--
:Clayton E. Cramer {pyramid,pixar,tekbspa}!optilink!cramer

Actually it is more complicated than this, but suffice it to say there are 256 different data rates possible and 256 different frame sizes. During cruise, 40 bps is used for engineering data and sometimes 1200BPS for general science (not imaging) and engineering. Currently, there is 21.6kBPS for imaging and 40 BPS for engineering.

Uplink rate is 16BPS only.

So far, all Alinco radios I have seen have LED displays instead of the LCD ones we need here in the United States where we have sun shining in our cars (don't know why they don't have it in Japan). Now if Alinco will develop an ATTITUDE like "we WANT to sell to the American market" and make products FOR the American market instead of Americanized products originally designed for Japan, then they will get my business.

My understanding of compandoring, or at least one flavor of it, is that the dynamic range of the audio is tightly compressed so that a logarithmic range of say 50 db becomes a range of 10 over the air. The receiver changes each db of incoming dynamic range into 5 db (for this example). A base reference is needed, hence the pilot tone giving a fixed reference of signal strength so that the compressed range can be restored to its original position.

The co-channel interfering signal might perhaps be 10 db lower. It will add 10% to the pilot level, dropping the uncompressed output in the receiver by... (10% is pilot increase of 0.414db, signal ratio decrease of same, uncompressed as 5*0.414db or...) 2.07db. The interfering signal, however will already be 10% lower, hence is 10 db weaker, and when uncompressed, is 50db weaker, and this appears to be 47.93db lower.

By dealing with things in a logarithmic way, there can be an APPARENT capture effect. Narrow band FM does not even have that good of an effect under many of the conditions I frequently hear on 2 meters.

Plus I suspect that there is no need to check for profanity. I would
think that it could take 10 or 15 minutes of human time to check for
this, unless there is an AI type program to assist them (ahah, a new
product :-).

Of course, if they didn't require a copy of your license in a
particular state, one could attempt to slide something by them.

For example:

K1WTF ; I can hear it, "CQ CQ CQ. This is Kilo One
Whiskey Tango Foxtrot. Whiskey Tango Foxtrot"

A1SS ; I think I'd want my advanced call back.
A1NUS
W8SHT
AA4Q

Maybe an interesting variation to this thread would be which
GENUINE calls fall/fell into this category. Maybe if the DMV won't
accept it, it is reason enough to request a new call.

As printed in the April 1989 issue of the RCMA Newsletter:

x
CLEAR ALL CHANNELS IN YOUR COBRA OR UNIDEN/BEARCAT SCANNER

by Bob Parnass, AJ9S

According to the Uniden/Bearcat 200/205XLT Service Information Manual, the following procedure will zero all 200 channels, then load channels 1-25 with various test frequencies.

1. Press and hold three keys: 2, 9, and MAN simultaneously and turn the power switch on.
2. Set the power switch to the off position.
3. Repress and again hold three keys: 2, 9, and SCAN simultaneously and turn the power switch on.

Some of the frequencies will be out of range, like 108.5 and 66.45 MHz, but will not permit reception.

This procedure works on other models as well. Harold Wong tried it on his 100XLT. I tried it on my 760XLT, Bill Vojak tried it on his Cobra SR-15, and Mark Smith tried it on his Bearcat 70XLT. We all met with success!

CEO comments:
FYI.

CEO file contents:
I have recently purchased the aforementioned transceiver. I have had no problems to speak of and enjoy the rig thoroughly. I would like to submit the following mod for the rig. Note that implementation on this mod is at the rig owner's risk and may violate warranties. Here is a description of the mod:

o Remove two screws from the top near the front of the rig.
o Remove the bottom cover (8 screws: 4 underneath, 2 on each side)
o Remove the plastic rear panel. (8 screws)
o Remove the rear metal panel. (10 screws in back + 1 on each side)
o Loosen the "hinge" screws on the front bottom. There are 4 of them.
o CAREFULLY lift front of the rig over the bottom watching as to not destroy the two bundles of wire that run vertically in the rear corners of the rig. There are two power supply lines that need to be disconnected in the midst of this manuever; they have connectors near the power supply. (Remember to reconnect them on assembly.) You will now notice that we have exposed a small circuit baord (the control board). Underneath it is the one we want under the metal covering. You may want to remove the two screws located near the front of the rig. Note that this board is the same one that has the switch that allows changing the tuning dial from 5kHz/rev to 10kHz/rev.
o Locate switch S01 and change its position. The rig will now transmit from 1.5 to 29.99999 MHz.
o Reverse the disassembly procedure.

Well that's it. You are now ready for any band addition that may come our way. If you have problems, reply; I'll try to answer your questions.

From: Robert_S._Karz.WBST311@XEROX.COM
Message-ID: <890825-085440-11178@Xerox>
Source record: 17353

Bruce Steinberg's note (N6LZ) really brings back memories. I've got a few more candidates of my own for the calendar:

* The Heathkit AR-3 receiver (much better than the National SW-54 I had with its ersatz bandspread tuning and cheaper as well. Sure felt my buddy with the AR-3 had a better deal than the hard earned $60 I shelled out for the 54)

* The Hammarlund Superpro receiver (really impressive with all those knobs and dials - absolutely "profesh" ...short for professional)

* The Heathkit Apache transmitter (real AM plate modulation at a price you could afford, but definitely hernia time when it came to doing work under the chasis)

* The Johnson Viking Valiant transmitter (Cadillac of the airwaves....The Collins was the Rolls Royce... - a friend spend a full year cutting lawns to buy one)

* The Heatkit DX-40 transmitter (only had screen grid modulation. The transmitter for novices and less affluent generals)

* The Hammarlund HQ-100 receiver (my second receiver. General coverage with ham bands calibrated on REAL bandspread tuning. Even had a Q multiplier for QRM. Big improvement over the SW-54)

* The Hammarlund HQ-145 receiver (big brother to the HQ-100. I believe it even had a crystal filter)

* The Hammarlund HQ-170 receiver (Ham band only, but like the Valiant, was a Cadillac. The Valiant, HQ-170, and Mosely TA33 - yep, the TA33 is that old - made a dream rig.)

* Homebrew 813 transmitters with 866A mecury vapor rectifiers (I used to operate with the lights off just to experience the warm deep blue glow from the 866s. Great on a cold winter night.)

There were a number of retired OMs (originally from the NYC area) living in south Florida on 15M phone who I used to chat with after school. This was in the early '60s. I remember one was Moe Stabin - I forget his call. He used to run occasional phone patches to my grandmother who patiently endured the QRM and QSB so her grandson (then about 13 years old) could show off. Did anyone else on the net work the south Florida retired crowd?

Cross-posted to: rec.ham-radio,sci.electronics,rec.video

Does anyone out there know of a **good** technical
reference book on the retrofit of transmitters with new
design klystron, Klystrode *, MSDC *, or HF tetrodes?
We were thinking about buying a used RCA TTU series transmitter
and wanted to explore the options.

For that matter, the subject of UHF amplifiers is
of interest.

Thanks

York David Anthony

From: jle@hpfcdc.HP.COM
Message-ID: <7880076@hpfcdc.HP.COM>
Source record: 17340

I saw this go by, but didn't trap the information. Would those in the know please post a followup or a summary, if one exists.

Questions about 10 meter radios.

Apparently Radio Shack has a 10 meter radio out.

Model HTX-100?

Is it low/high of 5/25 or 25/100 watts?

Number of memories? Is it expandable?

Is there a mod for out of band to listen to the CB chatter and speed trap advisories?

If modded, does the display show just the frequency or the freq and the "CB channel number"?

Is there a comperable model from UNIDEN?

Is it better/more options/easier to mod/exactly the same?

Someone came by my desk and wanted to know. I think I saw most of this on the net, but I don't remember.

2271. Reverse autopatch????

Newsgroup: rec.ham-radio
Date: 1989-08-25 16:42:12 UTC
From: ST5631@SIUCVMB.BITNET
Message-ID: <8908260704.AA27027@ucbvax.Berkeley.EDU>
Source record: 17354

As long as the net seems to be on pizzas and repeaters, what does everyone think of the legalities (and personal views) of reverse autopatches?

Legal or not, that is the question.

Any responses may be posted to the net or direct. Just some food for thought.

Cliff-

I also redid my figures and actually I can hear considerably better
than -150dBm. My transmitter output (at the dish feed) is +23dBW
(200W). My feed isn't optimum, so dish gain is a little low-
actually about 28dBi. Path loss of the Lunar-reflected signal at
1296 MHz is 271dB. This gives a signal power (at the input to
the preamp) of -192dBW.

The preamp is a homebrew unit with a Noise Temp of 35K (0.5dB NF).
Its noise power (in 100Hz BW) is -193dBW. Since I can JUST hear my own Lunar
echoes, I can assume a unity (or slightly better) SNR. The
calculations say my echoes should be 1dB out of the noise (193-192).
-192dBW = -162dBm, so I'm actually hearing about 12dB better than
the -150 we were discussing.

BTW, my 3m dish and preamp "sees" about 10dB of quiet Sun (whatever
that is) at 1296 MHz.

Not too bad for a poor kid, eh?

This discussion has been an interesting exercise for me:

I've gained quite a bit of info about Voyager from you JPL guys
(thanks) and my calculator has gotten quite a workout :^)
Actually, one of the things I like about non-ionospherically
propagated signals is that they really stand up to the number
crunching exercises, and, in the case of EME experimentation,
you can verify your calculations by testing, or verify your
tests by calculating (unless the Aurora is in, or the moon is
on the horizon, or a major Solar storm is in progress, or...)
Anyway, you get the picture.

Source record: 17341

I was listening on 10m last night and couldn't believe what I was
hearing. I haven't been on 10 in a long time, but still...
In the novice/tech section from 28.3 to 28.5, I heard lots of
people right on top of each other, and most of them were on
even 5KHz freq's. They were talking like CBers - 'Come on back',
etc. It didn't seem to bother anyone that there were so many people
on the same frequency you couldn't understand any of them. One guy
spent about 5 minutes reading from a book!

All I could figure is these are a bunch of new hams (former CBers)
using converted CB transceivers. Is this true? If so, the peak of the
sunspot cycle is really gonna cause a mess on 10. Does anyone
know if this is what's happening? And how do we break it to
these guys that this kind of operation is frowned on in Ham Radio?

Brian Wood, W0DZ

2275. GE 6146B Tubes

Newsgroup: rec.ham-radio
Date: 1989-08-25 18:23:52 UTC
From: n2ic@drutx.ATT.COM
Message-ID: <12116@drutx.ATT.COM>
Source record: 17342

I am having a problem with my TS-830 and low power output (as well as power input !).

After purchasing a pair of GE 6146B tubes, the Kenwood service department is telling me to throw them away and buy Sylvania or RCA.

Kenwood claims that GE now specs their 6146B's at 6.7 VAC filament voltage, rather than the normal 6.3 volts.

Does this sound reasonable ?

Do I have any recourse for getting a refund on my non-standard 6146B's from GE (naturally, the place I bought them from won't take them back !) ?

DEUTSCHLAND-RUNDSPRUCH DES DARC NR. 27/89 VOM 25.08.1989

BONN:

Das "Gesetz ueber Fernmeldeanlagen" (FAG) wurde aufgrund des Artikel 5 des Poststrukturgesetzes neu gefasst (siehe cq-DL 8/89, Seite 515). Die ab 01.07.1989 geltende Fassung wurde unter Verfuegung 808/1989 im Amtsblatt des BPMT Nr. 90 vom 10.08.89 veroeffentlicht. Da dieses Gesetz u. a. in die Besitzrechte von Sendeanlagen (z. B. bei Erloeschen einer Amateurfunkgenehmigung) eingreift, ist jedem Funkamateur die Beschaffung dieses sechsseitigen Textes (DIN A4) zu empfehlen. Der Vertrieb amtlicher Blaetter des BPMT, Postfach 10 90 01 in 5000 Koeln 1, gibt auf schriftliche Bestellung bis zu zwei Amtsblaetter kostenlos ab. Jedoch wird bei Bestellung von drei oder mehr Exemplaren ein Stueckpreis von 1,20 DM einschl. Versandtkosten erhoben.

SURREY:

UoSAT 1/OSCAR 9 naehert sich seinem Lebensende. Der im Oktober 1981 in eine polare Umlaufbahn in 555 km Hoehe geschossene Forschungssatellit der Universitaet von Surrey war im Juni 1989 auf 390 km gesunken. Aufgrund der Bremswirkung der aeusseren Gashuelle der Erde, des wechselnden Sonnenwindes und planetarischer Einfluesse verliert er taeglich schwankend etwa 400 m Hoehe mit zunehmender Tendenz. Die Aenderungen der Umlaufzeit lassen sich anhand von Doppler-Messungen der Satellitenbaken ermitteln. Diese senden Fernmesssignale im Telegraphie-Tempo 60 BpM. Nach 10 Messwerten folgt jeweils die Kennung "AMSAT". Als Frequenz sind angegeben: 14.002, 21.002 und 29.502 kHz sowie 145,825 und 435,025 MHz. Die AMSAT/UK hat zahlreiche Preise fuer die besten Schaetzungen fuer das Datum des Vergluehens des OSCAR 9 bei Wiedereintritt in die dichtere Atmosphaere nach Jahr, Monat, Tag und UTC ausgesetzt. Bei neueren Erkenntnissen koennen auch weitere QSLs mit dem neuen Schaetzdatum eingesandt werden an UOSAT 1, Orbital Decay Competition, AMSAT/UK, 94 Herongate Road, Wanstead Park, London E12 5EQ, England. Bedingung: Eingang einen Monat vor dem Enddatum.

BAUNATAL:

Vom 07.-16.08. bereiste eine Gruppe sowjetischer Funkamateure aus der Autonomen Sowjetrepublik Komi die Bundesrepublik. Dabei

handelte es sich um einen Gegenbesuch zu der Reise westdeutscher Funkamateure nach Komi im Mai dieses Jahres. Nach einem Besuch des Amateurfunkzentrums in Baunatal hielten sich die sowjetischen Funkamateure zunaechst einige Tage im Distrikt Ruhrgebiet auf. Hier standen Besichtigungen von Automobilfabriken und Stahlwerken sowie Empfaenge auf dem Programm. Bei einem Besuch des OV Gladbeck wurde ein Vertrag zwischen dem DARC-Distrikt Ruhrgebiet und der Radiosportfoederation der Autonomen Sowjetrepublik Komi unterzeichnet. Dieser Vertrag sieht eine verstaerkte Zusammenarbeit zwischen beiden Verbaenden vor. Nach einem Besuch des Deutschen Bundestages in Bonn folgte die Weiterfahrt nach Muenchen, wo die sowjetischen Funkamateure von jener Jugendgruppe begruesst wurde, die seinerzeit zu Gast in Komi war. Auch hier gab es Besichtigungen und Empfaenge. Unter dem Rufzeichen DL0MIR wurde am WAE-DX-Kontest teilgenommen. Ferner wurde das Clubheim des OV Eching besucht. Nach vielen persoenlichen Begegnungen wie auch zahllosen Funkverbindungen, insbesondere ueber FM-Relaisfunkstellen, traten die sowjetischen Funkamateure am 16.08. ihre 60stuendige Heimfahrt an.

HALTERN:

Aus Anlass der 700-Jahr-Feier der Stadt Haltern richtete der OV Haltern, N42, im Distrikt Westfalen-Nord die diesjaehrige Deutsche Peilmeisterschaft aus. Mit etwa 70 Teilnehmern, hierunter auch Besucher aus dem umliegenden Ausland, war die ausgezeichnet organisierte Veranstaltung ein grosser Erfolg. Deutscher Meister im Amateurfunkpeilen auf 2 m wurden am 22.07. bei den Senioren DL2UO, DL3SAK und DL3BBX. Allerdings schoben sich zwischen Platz 1 und 2 die beiden tschechischen Teilnehmer OK1VAG und OK1FJW. Bei den Damen erhielten DL2NBE, DL4YCR und DD9GP die Medaillen. Auch hier schob sich Sarka Stronkalova aus der CSSR auf den 2. Platz. Bei den Oldtimern erreichten DK9JP, DF3ZY und DJ9NW sowie die bei den Junioren DH6SAN und die SWLs Markus Angel und Manfred Kohl die ersten drei Plaetze. Ein grossartiges Hamfest mit Siegerehrung und Tanz beschloss den erlebnisreichen Tag.
Beim 80-m-Wettbewerb am Sonntag morgen waren die ersten Plaetze wie folgt verteilt: Senioren DH8YAQ, DL2OU und DF3KT. Diesmal waren OK1FJW und OK1VAG aber fast 10 Minuten schneller als unsere Senioren und belegten die Plaetze 1 und 2. Bei den Damen war das Ergebnis gleich dem auf dem 2-m-Band, waehrend sich die Oldtimer diesmal wie folgt plazierten: DJ9NW, DF9ZY und DJ2UE. Die Junioren-Liste beginnt mit Manfred Kohl, Uwe Zeise und DH6SAN.
Nach dem internationalen Peilwettbewerb in Luebeck war dies die zweite grosse Peilveranstaltung, die der DARC im Juli durch den Einsatz hervorragender Organisatoren mit grossem Erfolg veranstalten konnte.

BERLIN:

Vom 25.08.-03.09. findet wiederum in Berlin unter dem Funkturm

die weltweit groesste Messe auf dem Gebiet der Unterhaltungselektronik statt. Einer langen Tradition folgend, wird der DARC-Distrikt Berlin auf der Internationalen Funkausstellung den interessierten Besuchern Amateurfunk als eine sinnvolle Freizeitbeschaeftigung naeherbringen. Wie vor zwei Jahren wird der Informationsstand des DARC in der Halle 15.1, Standnummer 03, zu finden sein. Einweisung erfolgt auf 145,500 MHz. Die Ausstellungsstation DK0IFA wird in fast allen Betriebsarten QRV sein und auch wieder den begehrten Sonder-DOK IFA vergeben.

BIERSDORF:

Die Referate Amateurfunkpeilen und Jugend und Ausbildung des DARC-Distriktes Rheinland-Pfalz veranstalten am 03.09. ein 80-m-Peilseminar fuer Anfaenger. Das Programm sieht unter anderem Kurzvortraege zu den Themen Wettbewerbsablauf, IARU-Regeln, 80-m-Peiltechnik vor. Den Schwerpunkt bilden jedoch einfache Peiluebungen, die den Anfaenger in den Richtigen Umgang mit dem Peilempfaenger einfuehren sollen. Der Kostenbeitrag betraegt 15,- DM bzw. 10,- DM fuer Schueler, Studenten und sonstige Ermaessigungsberechtigte. Weitere Informationen siehe cq-DL 7/89. Anmeldung bei Olaf Herrmann, DF8WO, Schulstr. 2 in 5521 Biersdorf, Tel. 06569/7147.

DARMSTADT: (22.08.)

Nach dem Rueckgang der Sonnentaetigkeit im Vormonat ist im Laufe des August ein heftiger Aktivitaetsschub eingetreten, der allerdings von jetzt an wieder durch eine ruhige Phase abgeloest werden wird. Zwischen dem 12. und dem 20.08. ereignete sich ein langanhaltendes Protonenereignis, das u.a. verstaerkte Absorption im Polarbereich nach sich zog und den Funkverkehr auf den noerdlichen Linien beeintraechtigte. Ab 16.08. produzierte eine aktive Region einen heftigen Roentgenstrahlungsausbruch, der jedoch zu nur schwachen Auroraerscheinungen fuehrte, da das Aktivitaetsgebiet bereits den Westrand der Sonne ueberquert hatte. Eine Mittelung der Tageswerte von Sonnenfleckenrelativzahl und 10-cm-Strahlung ueber die ersten 20 Augusttage ergibt 227 bzw. 238 Einheiten. Die Hoechstwerte der F2-Grenzfrequenz schwanken um 8,5 MHz. Der Rueckgang der Sonnentaetigkeit wird sich voraussichtlich ueber das bevorstehende Wochenende hinaus fortsetzen. Ab Beginn des naechsten Monats ist mit einer erneuten Aktivitaetssteigerung zu rechnen.

Ende des DL-RS Nr. 27/89 vom 25.08.1989

>of radio?
>...
>What's the solution?
> Malcolm Slaney
> (formerly WN9QDG)

Hi, Malcolm. Sorry to see you are 'formerly WN9QDG' rather than just
'WN9QDG'

Anyway, since nobody else seems to have said anything, I'll add my
ignorance:

I would try connecting an antenna to the *ground* connection of the
headphone wire. My understanding is that the shield of the wire
is used as the antenna, thus connecting directly to the 'ground'
of the cable you should get the best results.

Of course, my understanding could be wrong, in which case you would
have to build an adapter to let you get to the wire which it DOES
use for the antenna and connect to that. Good luck, there is so
much hash where I work, and the signals are so bad, that it
is impossible to recieve *anything* on AM, and only the very
strongest stations can be heard on FM, if at all, so I understand
your situation.

Corrections from the net on my understanding?

Yes, the computer does radiate according to the program that is run.
A few years back I was working with PDP-8/A computers and some lonely
soul that liked music wrote a compiler that allowed the PDP-8 to play
music. In four part harmony!! You wrote the music into a ascii file
that was the input to the compiler. When the resulting object code
was executed you could listen to the music on a nearby AM or FM radio.
Sounded real good too.

Hello folks,
I am looking at the Yeasu 736R, and the Kenwood 790A...

I am mostly going to use it as a VHF/UHF base rig with some use in the future
as a rig for getting into the satelites... So what is better...

Also how much antenna is needed to make this work well for satelite?
Do I need those fancy "twist" antennas, fancy rotors, etc? This satelite stuff
is completly strange to me, HF and the local repeaters is how I spend my time
now...

In anycase any info is very welcome....

>
>New FCC rules will require the cable company to conduct routine leakage tests
>beginning next July.
>...

My understanding of this upcoming rule is even worse. Yes, they will have to conduct regular leaks (they already have to do that), BUT:

They will be responsible solely for leaks on their main cables. Each SUBSCRIBER would be responsible for leaks from the cable entry onto their property. The cable industry wants to get a box on the outside of each house and then be responsible up to that box only.

Imagine the problems of finding and correcting leaks when your next door neighbor is responsible for doing it, and the most they know about electronics is how to turn a light switch on.

NEW COUNTRY! KT7H will put Guemes Island on the Air!

This is to announce an expedition and application for new country
status for Guemes Island and Tatoosh Island, which are near the
border between British Columbia and Washington State.

Application to ARRL DXAC is being made under point 3 (b) of the
DXCC rules, which states:

"(b) Islands: Where two islands, of the government under Point 1,
are totally separated by an intervening DXCC country (also under
Point 1), each island counts as a separate DXCC country. No
minimum distance is required. The test for total separation
means that a straight line may not be drawn from any point on one
island to any point on the other island without passing through
another DXCC country. This intervening country may be a part of
either island, another island, or part of a continent."

Tatoosh Island lies off Cape Flattery at the Northwestern tip of
Washington State. The approximate latitude and longitude are 48
deg 22' N, 124 deg 48' W. Guemes Island is in Puget Sound, just
north of Anacortes, Washington. The approximate latitude and
longitude for Guemes Island are 48 deg 33' N, 122 deg 37' W.

I have searched the DXCC rules, published in the April 1988 QST, and cannot fine any exception that would disallow Guemes and Tatoosh Islands status as new DXCC countries. No matter how I try to draw a straight line between these two islands, the line always crosses the intervening territory of British Columbia (VE7). The criteria under point 3 (b) is very clear to me, and should be to anyone else who looks at a map of Washington State.

On Labor Day weekend, beginning around 2100 UTC on Friday, September 1, 1989 I will operate KT7H from Guemes Island. Operation will be on 80 through 10 meters, on CW, SSB and RTTY. The CW and RTTY call will be KT7H/GUE. USA QSLs are requested with SASE via the callbook address. DX QSLs will be handled via the bureau.

I look forward to the DXAC's early approval of Tatoosh and Guemes as new DXCC countries. I hope to provide many stations with a 'new one' on and after September 1!

If you have any questions, feel free to contact me at my callbook address, or via MCI Mail at 3288544. My packet address is KT7H @ N7HFZ.

73, Tad Cook KT7H @ N7HFZ

Well when I was first licensed one person I knew had his call CHANGED
(you could do that on request then) from VE3FAX to VE3FUX.
Called himself "the station that dares to be known by its call alone"!

You do meet all types in ham radio.

Oh yes, he had passed a 15 Wpm code test for his Canadian "Advanced
Amateur" license, even then cw wasn't much of a filter.

SpaceNews

MONDAY AUGUST 28, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* STS-34 NEWS *

The Shuttle ATLANTIS, along with its Galileo/IUS payload, is scheduled to be transferred to launch pad 39-B at the Kennedy Space Center, Florida at 12:01 AM EDT on Monday, August 28th. The tentative launch date for STS-34 is October 12th.

* MIR UPDATE *

The Soviets recently launched a new cargo carrier, Progress M1, to the Mir/Kvant-1 space station, currently in low-earth orbit. Progress M1 carried supplies to the orbiting space complex in preparation for the re-manning of Mir.

The primary and backup Soyuz TM-8 crew arrived at the Baikonur Cosmodrome on August 24th in preparation for their flight to Mir on September 6th. The crew will be spending 6 months in orbit.

Mir has been unmanned since Soyuz TM-7 left the space complex on April 27th after the power system on Mir started to show problems. However, ground control has been maintained with Mir & Kvant-1, since the Soviets announced that they recently made a new series of observations of a neutron star taken by the astrophysics module X-ray telescope on Kvant-1.

Keep tuned to Mir's voice downlink frequency of 143.625 MHz for the latest "action", live from space!

Here is a recent element set for Mir as issued by NASA on 22Aug89:

Epoch : 89 233.80762329
Inclin: 51.6201
RAAN : 34.8669
Eccen : 1.0176E-03
ArgPer: 303.5542
MeanAn: 56.5194
MeanMo: 15.59084499

Decay : 4.1791E-04
RevNo : 20139

* OSCAR-13 MODE S *

The Mode-S transponder was again extensive tested under
manual control. A hardware interface problem was discovered,
which will be fixed in future by a new software routine.
After the beacon was switched Off, excellent downlink signals
were found on the Mode-S transponder. Thanks to DF5DP and ON6UG
who assisted the experiments by watching the Mode-S downlink and
sending reports to DB2OS using terrestial packet radio links.

* UoSAT-D ELEMENTS *

Here is a provisional set for UoSAT-D at the point of injection into orbit,
as calculated by Craig G1WTW:

Satellite Name: UoSAT-D 09/11/89 - 01:55:34 UTC.
Epoch Orbit Number: 1

Epoch Year: 1989 Epoch Time (Days): 313.08025463
Epoch RAAN (Deg): 24.3439 Mean Motion (rev/day): 14.23617560
Epoch Arg.Per. (Deg): 167.3130 Mean Anomaly (Deg): 240.6300
Inclination (Deg): 98.7300 Eccentricity (0..1): 0.001362
Semi-Major Axis (km): 7187.6900 Apogee Height (km): 826.4796
Beacon Freq. (MHz): 435.070 Perigee Height (km): 806.9004

Decay Rate (rev/day/day): 1.00000E-006

* OSCAR-9 NEWS *

Spacecraft controllers are devoting more beacon downlink time to WOD and
telemetry.

Here's some recent Keplerian Data for OSCAR-9:

Epoch : 89233.06183778
Inclin: 97.5441 deg
RAAN : 291.5364

* SpaceNews DISTRIBUTION *

David Hopkins, VK4ZF of the Australian Space Education Association would like
to receive SpaceNews on a regular (weekly) basis via packet radio at the
VK4XBB-1 BBS in Brisbane, Australia.

The VK4XBB system can be reached via VK4BBS (AsiaNet). At the present time, SpaceNews is being received as a bulletin that orginates in Switzerland, then passes through Holland, Indonesia, and the Philippines before arriving in Brisbane.

Could someone please distribute SpaceNews to VK4ZF via a more "direct" path??

Thanks! de John, KD2BD @ NN2Z

* FEEDBACK WELCOMED *

This sounds like the changes in telephone service that allows us to wire
our houses as we please.

Does this mean that we can wire every room in our house for cable
rather than having to pay the cable company an installation fee and
monthly fee?

I have not gotten this impression. Some articles I have read did meantion that
in terms of leakage interference to radio services, the main cables would be
where to concentrate BECAUSE they had the strongest signals (40db or more over
what a subscriber drop has sometimes). It leaves with the impression that they
are still responsible for whatever they install. Perhaps some cable companies
are getting around this in some ways by "selling" the in house installation so
that they no longer own what's in the subscriber's home, leaving themselves not
responsible (but still willing to fix a problem that would threaten to cause
the subscriber to cancel service, within cost limitations).

I will have to look up the actual FCC rules to double check all this.

> Thanks.
> Jim, NE3X
> rachiele@nadc.arpa

Yes, the Icom "modular thing" has a 220 module you can add on.

The IC-900 needs at least one module to get on the air. Most places bundle
it with a 2 meter module (afterall, who would not want 2 meters, right?).

The IC-901 has 2 meters and 70 cm builtin, but can take the same modules to
add more bands.

Modules for 10m, 6m, 2m, 2m SSB, 135cm, 70cm, and 23cm are available.
There is no 33cm module (no such band in Japan + low American demand).

Source record: 17367

> 0) What is the best way to advertise the class?

Just about every which way you can. Every radio and TV station, and most newspapers have a "community bulletin board" type of service. Make use of it by sending them a notice or press release about it 3 to 4 weeks ahead.

> 1) What seems to be the right length for the course? 8 to 10 weeks,
> one evening a week for 2 to 2.5 hours?

That's about right time-wise, but it can get boring easily. Our club has done this for a few years this way for Novice, but the drop out rate is very high. We are trying a 2 day concentrated format this year, 3.5 hours on each of two Saturday's.

> 2) What should be the split of class time between theory and code?

For Tech's, 1:0. If you are going to teach both Tech and General at the same time, you might need to structure it so that the Tech students do not have to sit through the General material, especially the code. Remember all those arguments against a codefree license like "5 wpm is easy enough that anyone can get with some study, then get a Tech and be happy on 2 meters"? Well, there they are in your class. Don't scare them away with 13 WPM or even HF propogation (no longer on Tech test).

For General, perhaps 1:1. If you are working on just increasing the speed, then code practice tapes can do it. For a Novice class they are usually inadequate.

> 6) What is the most effective method for having folks increase their
> code speed?

How did these numbers get out of order?

IMHO, forget the slower speed and just learn the faster speed.

> 3) What are some of the best in-class exercises for practicing theory
> and code?

This would be a good question. It depends on the students. For lots of young kids that's easy for the code. Just have them send messages to each other by some means. For the theory (and don't forget rules, too) this would be a lot harder, and may require some creativity and teacher training.

> 4) What types of quizzes or tests should be given, and how often and
> when?

Just like the real one. Hand out sample tests to take home.

> 5) What are the best out-of-class exercises for working on the theory
> and the code? Should there be regular homework?

10 weeks of 2 hours might not need any homework, but code practice tapes
would always be a good idea to at least have available.

> 6) Based on your prior experiences with ham license classes, what
> things should be avoided in the class?

Making the classes boring should obviously be avoided.

> 7) What things would make a class better, based on your prior
> experiences with ham theory and code classes?

For theory, give examples of when knowing the theory actually helps out doing
something.

I also believe the shorter more concentrated format will have fewer bored
students and reduce the drop out rate.

> I bought my HR2510 from AES in Milwaukee - one of the first questions I
> was asked was "do you have an Amateur Radio license" and "what's the
> callsign". I found this neither obtrusive nor offensive, in fact, I
> am happy that they are so conscientious.

I, too, was asked this question from AES. I responded that I did not have
a license (I really didn't then) and they said "That's ok" and went ahead
and sold me HT's for 3 bands.

At least they put the issue across in your mind. I still would rather deal
with stores that required that all equipment obviously capable of transmitting
on amateur frequencies be shipped to a licensed ham. Persons working on a
license and wanting to get equipment in advance can have it shipped to their
Elmer. When I hear of a dealer practicing this, they will get more of my
business, and if other things are not wrong, all of it.

Sigh. More on saying callsigns. Phonetics are passe'. You're supposed
to pronounce the suffix as a word, or pseudo-word.

A friend of mine was xx6CUM; we used to refer to him on the air as
"cumspot". Alas, he now has one of those unpronounceable new-wave calls
like WZ42X or something. I can't even remember it, much less pronounce it.

At one time I held the calls WB6IDS, WB6ZUK, WR6AHR, and WR6APG in addition
to my primary and club calls.

IDS was just "dwids" or "wizard of id".

ZUK was just pronounced as it looks. That particular remote base had
touch-tone decoders built out of 88-mhy phone toroids and often falsely
decoded functions when you yelled while talking through it. After a bit
of practice several of us got good enough at it that we could yell
"ZUK OFF" and it would shut down. Sure impressed the hell out of the
old farts with their rice rockets. Wow! A voice-controlled remote base
in on the air 1974!

AHR was obviously "A** Hole Radio." I think we left the "ss" out of the
voice id on the repeater. Don't remember - it was 15 years ago when that
repeater was up.

APG was known as AcaPulco Gold. It was the local high-school and
college people's repeater - it had a 30 second blab-off timer to keep
the old farts off. Once an hour, the voice id'er said "This is WR6APG.
Makes your eyes water just thinking about it."

Am I boring you?
- Brian

2295. NASA Prediction Bulletins

Newsgroup: rec.ham-radio

> Arun WC6V
>
Of course, according to the plot of the movie, the terrorists wanted to attract the attention of the police. Perhaps these units had an out of band mod (like those frequently posted to this newsgroup) and Bruce Willis' character actually thought he might have an emergency on his hands and therefore felt that he could legally transmit some kind of emergency message on a common emergency frequency. Or maybe he should have the presence of mind to go back and recheck Title 93 US Code while being hunted down by terrorists who ruthlessly killed several people right in front of him. Remember, he didn't have much choice about a medium to notify the police ... and he used all other available signaling methods BEFORE he made an "illegal" tranmission. Frankly, when you're in deep enough to blow out the entire 3rd floor of a Century City building ... I don't think you are going to worry much about ruffling a few feathers at the local FCC monitoring post.

We used to write programs for CDC 1700 & 3600 series computer systems that toggled bits in a register and/or wrote at frequent intervals to a printer cable to generate music. Both approaches worked really well. Indeed, our programs were actually able to generate music with several "voices".

Source record: 17372

You should consider contacting your local DoD military area frequency coordinator and/or a local federal IRAC coordinator ... much of the potential for harmful interference from cable television leaks will be spread throughout the 225-400 MHz military/aerospace spectrum ... in the past DoD has insisted on strict control over cable television emissions in order to minimize the risk of interference with military aeronautical voice and navigation communication systems. I doubt the people responsible for maintaining the security of military aircraft will take kindly to this kind of tomfoolery.

2300. Microwave Misc.

Newsgroup: rec.ham-radio

Message-ID: <162539@Wayne-MTS>
Source record: 17362

Thanks to all who responded to my inquiry- particularly for not
mentioning the various typos, like "QRX" instead of "QEX". I
do a lot of my posting at 1:00am on weekends...

Anyways, I bought a copy of the Microwave Newsletter Technical
Collection (RSGB), and have a few questions- these may be translations
need from English to American:

Tuning screws are spec'd with numbers like 2BA, 6BA, 8BA; are
these directly translatable to US #2, #6, #8 and so forth?
Some are spec'd as M2.5/6BA - I assume M2.5 is a 2.5 mm metric.
Is this equivalence or substitution. Another is listed as
"M2 or 8BA".

While I'm familiar with notations like 4K7 for resistors (4.7K),
I've not come across "33R" or "4R7". Do these two equate to
33 ohms and 4.7 ohms? (Where's the omega key on this keyboard...)

Thanks to various respondants, I now now of a number of componants
to be on the lookout for when I hit the Findlay swap on 10/10.
And speaking of which...how about a suggested simplex frequency for
down there, or perhaps both a 2 and a 440? Any correspondants who'd
like to hook up while down there can catch me on 146.295, my local
group's "secret" swap frequency. Any other suggestions welcomed.

The only time I was asked was when filling out a sales receipt
rather after the fact. I figured they probably just use it to
figure out to mail there junk mail. At HRO I walked in, played
with the radios (transmitting) and such without giving any indication
that I had a license. I was carrying a rather old 2M HT with me.

Message-ID: <8908280702.AA00127@ucbvax.Berkeley.EDU>
Source record: 17231

Fellas, did you guys ever stop to think that the radio he had may have been a non-functional casing that was rigged to light the LED when the transmit button was depressed? Kenwood probably paid a LOT of money to have their radio prominently displayed in a shot. It's advertising. This is done all the time. I would bet that the radio did not work. I am also sure that they were more concerned that you recognize the KENWOOD logo and not that it was a TH-4 whatever radio. Actually, had the producers thought it would look better, Kenwood would have probably a two-meter dish on the antenna BNC connector.

Relax. I'm sure no one wanted the hams to freak out because it happens to be an amateur radio. Most people probably don't even know that anyway. I think that's being a bit too reactionary.

Besides, the stupid part of that movie is the sheer volume of ammunition expended. Compared to that, I thought the radio was trivial.

They just wanted a radio that looked hi-tech. Relax.

I laughed so hard I almost snorted an antler
when "Robert_S._Karz.WBST311"@XEROX.COM said,
HA! Bruce Steinberg's note (N6LZ) really brings back memories. I've got a few
HA! more candidates of my own for the calendar:
HA!
HA! <...>
HA!
HA! * Homebrew 813 transmitters with 866A mecury vapor rectifiers (I used to
HA! operate with the lights off just to experience the warm deep blue glow from
HA! the 866s. Great on a cold winter night.)
HA!
HA! There were a number of retired OMs (originally from the NYC area) living in
HA! south Florida on 15M phone who I used to chat with after school. This was
HA! in the early '60s. I remember one was Moe Stabin - I forget his call. He
HA! used to run occasional phone patches to my grandmother who patiently
HA! endured the QRM and QSB so her grandson (then about 13 years old) could
HA! show off. Did anyone else on the net work the south Florida retired crowd?
HA!
////////////////

Bob, I'd say that to a 15 year-old kid, there were few better
gut-level reinforcements linking electronics and said kid for all
time than watching the plate color of a pair of 813s or 826s
instantaneously changing while pumping your own voice out to
someone a couple of hundred or more miles away on one of those
cold winter nights. And no repeaters - just you and all the
effective radiated power you can muster for your own personal
RF beacon into the dark beyond.

My OM, now part of that South Florida retired crowd, never really
understood the big deal about working hard for DX, when he could
leisurely ragchew about the weather and his problems with his rig
with some other guy he actually knew a few miles away who was
having the same weather and same problems with the same rig.

But he indulged my 6-meter DX thing with bemused tolerance -
along with complete insensitivity to the protocols of the
pursuit. I recall him early one Sunday morning shaking me from a
sound sleep, saying only, "Hey, wake up, I got someone on the air
wants to talk with you." I rolled over, convinced it was one of
his local buddies we could probably ~drive~ over to see in five
minutes, and mumbled, "Can't we do it later..?" "I don't think
so..." he said, dragging me off to the rig.

What I next heard was sheer chaos, a veritable DX feeding frenzy of at least a dozen local VHF DX freaks, some of whom I recognized instantly, pitifully screaming "BREAK, BREAK, BREAK..." to a callsign with some indecipherable prefix I was sure I'd never even heard of, let alone worked.

With about the same nonchalance he would've mustered for a Lenny or a Frank in Flushing, the OM hit the xmit/rcv switch and said, "Okay, Fred, hope you're still with us here. I got the Jr. Op with me here now, and I'm sure he'd like his own QSO with you - like I said, his handle's Bruce and his call is K2VDR - so I guess I'll just say thanks and 73 for now, and turn it over to him," just like he was passing the baton to the anchorman in our own personal two-man relay race. I still wasn't sure what I was doing up, or whom he was talking with, but I had an ominous feeling I was about to find out, and I did: "HC1FS, in Quito, Ecuador, this is W2SCA in New York, over and out."

There was about five seconds of more frantic screaming from even more breakers, enough time for me to start to turn red in the privacy of my own home, wondering how long the OM had been keeping this Rare One on the hook - probably asking him if he had the same rig and the same weather down there, and what he was doing about it. I hoped perhaps it was just mass hallucination, or at least a crazed bootlegger playing games from New Jersey.

And then, all of a sudden, there he was, with the patience, tact and 30-over-nine signal strength of a God: "Ah, W2SCA, this is HC1FS. Ah, okay, Art, starting to get a LOT OF QRM on you now. Band must really be opening up now. Never HEARD any north-south path like this before - I'd better get going and take care of some of these other guys while I can. But roger on the Jr. Op, and I'll stand by for him now. So, Bruce, if you're there, ah, K2VDR, this is HC1FS, over..."

He had that inimitable long, slow F2 QSB, and I knew this was no hoax. I couldn't stand to hear the anguished cries of the exponentially increasing number of breakers anymore, and hit the switch instantly. No meteor-burst QSO ever took place faster - signal report, thanks, break, and OUT of there. I wouldn't have had the guts to hang him up one more second if it didn't take.

But it did, and he confirmed, nice and slow, that I was thirty-over-nine, too, and I started to get the feeling the OM had found a soulmate who just happened to live in Ecuador before anyone else even realized the band was open, and that Fred would just as soon have just kept chewing the rag with the OM that morning. I never heard another South American on six - that morning or ever again - and in about ten minutes the band went dead, but not before I heard Fred work a bunch of folks I couldn't hear all over the Eastern US.

The OM was glad THAT was over, and hooked up with Lenny and Frank in Flushing to talk about their rigs and the weather and the craziness of DXers. I went back to bed and pulled the covers over my head, full of new dreams of a WAC on six that would never happen.

And I guess when the QSL came in a few weeks later with a real Ecuador stamp and Quito postmark, it was the first time I knew for sure that the whole thing hadn't been one big dream in the first place. And that I owed a big one to the OM - even if every 6-meter DX head in the New York metropolitan area thought he was a complete lid that Sunday morning.

Even Lenny and Frank could understand that.

Perhaps the new rules should stipulate that if there are cable leaks coming
from within a subscriber's home, the cable company will disconnect the service
until the subscriber has the problem fixed.

Hey, "Die Hard" had logical holes in it big enough to drive that
APC through. So what? Why didn't that turkey Deputy Chief take
over the HT communication with McLain as soon as he arrived,
instead of leaving it to Powell (and criticizing him about it, to
boot) for as long as he did? Why didn't that hostage weasel
offer up McLain's wife before they blew him away? What the heck
was that "level-7 electromagnetic lock" all about? And why did
that plastique go off just because he dropped it down the shaft?
This is not a movie to do a lot of deep thinking about - it's a
celebration of full-tilt, permanent brain damage, and that's its
native charm. Definitely not to be confused with "Citizen Kane."

Actually, if you recall, McLain actually DID try to bring the
FCC into the action out of desperation when the woman on police
dispatch was giving him a hard time and threatening to report him
if he kept misusing the communications medium (presumably CB Ch9
patched through to her switchboard).

His only mistake was that he didn't use his mystery, all-purpose,
full-duplex, amateur/commercial, 2M/CB/UHF/cellular HT to request
a local L.A. ham to patch him through to a local 2M FM repeater
to order a pizza from Domino's, and then call someone at a USC or
JPL USENET hub to report the incident on rec.ham-radio. That
would've put an end to all THAT nonsense - FAST!

TO : Phil Graham, regarding FT736 vs TS790

I have an FT736 and have used it for nearly a year. Here are
some observations: The rig was designed (apparently) with the
interests of (1) Satellite users (2) FMers (3) Weak signal types
(4) EMEers in that order. As a satellite rig, it's great. Enough
power for barefoot modes B&J although you will need one of those "fancy"
circularly-polarized antennas. [That's true for almost all satellite
systems due to the way the birds themselves are made]. Real slick VFO
tracking, and easy to use. FM performance is good, I suppose,
although I don't operate FM. Weak-signal and EME performance are fair;
the '736 needs a preamp badly. Unfortunately, adding a REAL preamp is
quite a bit of work because the rig T/R switches so fast; it burns
the preamp up before relays can get the preamp out of the way. You
must use an external sequencer.
The '736 has two major disadvantages. First, it will not receive
outside the ham bands. Strange but true. Second, its memories are
not tunable; once a frequency is stored in them, it's hard to change [ie
you can't tune within a memory except using RIT].
I appealed for mod information on the '736 a couple of weeks ago and
got zero responses [not counting others who also sought info].
In summary: it's a fair-to-good rig, with a high-to-ridiculous price.

Gee. Reading about all those old rigs sure brings back fond memories. Especially the last posting by Bruce (N6LZ). I got my first tickets (novice and tech) at the beginning of the summer of 1959, the peak of the most super solar cycle ever. My rigs were a Heath DX-20 (6CL6 driving a 6DQ6, I think), an National HRO-60 (with plug in coil drawers to change bands and that funny dial that counted from 0 to 500 thru little windows in the circumfrence of the tuning knob) and a Gonset 6M Communicator. I guess mine was the new, modern model, since it was white and had rounded corners and a little handle on top. It had a 2E26 final running about 6W AM. It fed a "J" (half-wave vertical, +/-) about 80' in the air.

One Sunday afternoon a few weeks after getting my tech, I turned on the Gonset. There was an awful lot of activity on on the band -- lots of stations with funny accents calling CQ. Some were speaking spanish. Many were S9. Finally I heard one sign a call. I had to get out my ARRL handbook (cloth-bound, not this paper cover nonsense) and look it up. LU1 - Argentina! Even a callow novice/tech like me knew this was something special. I picked a likely candidate, hunted for a crystal near his frequency (synthesizer? VFO? not for a tech in 1959...) With trembling fingers, I pushed down that funky PTT switch on the front of the Gonset. Called. Listened. Called again. Come on, Guy, tune around a little. Finally, I heard him say "WA6HTJ?". Wow! That was a thrill I'll never ever forget, and after all these years, I still think of that as my best DX. About that time my Dad started yelling about the chores that I'd, as usual, failed to do. He wanted them done *now*. So I left the rig to take out the trash. By the time I returned, half an hour later, the band was back to its normal state.

I never forgot to take out the trash first thing in the morning, and I never heard another South Amercian on 6m. I did work a few states in the midwest that summer, but it was hardly the same thing. Now, when I hear one of the locals key up the club machine and announce "6M is wide open - I just worked Texas", I quietly chuckle to myself and think "OM, you have no idea what real 6M DX is!"

No, they are not directly translatable into US standards. However, if
you talk to a machinist, or maybe someone in your ME deptartment, you
will be able to get a listing of the British standards. I got a really
nice poster from some machinists at my previous employment site with
this data. This will allow you to pick the closest US "equivalent".

> dying breed.

Any ham radio operator you are in contact with when working on your license
can serve as your Elmer for as long as you need to get a rig, if the dealers
start restricting sales.

Surely you must contact at least TWO hams to take your novice exam these days.
I know of no dealer that ships so slow that the FCC license would arrive
before the rig, assuming the rig is ordered the same day as you take and pass
the exam. This is the worst case. Surely contact with hams is made BEFORE
taking the exam, and a rig can be purchased and shipped through that contact
well before that time.

The Kenwood 790 lacks the capability to operate on 50 Mhz, 220 Mhz or 902 Mhz.

The Yaesu 736 lacks the capability to operate on 902 Mhz.

It just depends on what you ultimately want to do with the rig.

with the comment

>We (U.S. manufacturers, and not just in the ham radio market) didn't keep
>up with the coming changes, and We (the U.S.A.) decided that sports was
>MORE important that knowing science and engineering.

You made an excellent point, Phil. Last October, I went to the 1988 World Expo in Queensland, Australia. It was a world's fair type of thing where many countries each have a pavilion highlighting some aspect(s) of the country. The theme of World Expo 88 was "Leisure and Technology" or "Leisure in Techology" or something like that. Several countries focused heavily on technology (I particularly remember France and Japan). Guess what the USA focused on? Yep, you said it Phil - SPORTS! It was like a huge USA hall of fame, USA sports history museum, etc. I guess science and engineering and its heroes just aren't as glamorous as sports and its heroes...

Substitution. They are not equivalent.
2BA - approx US #10 (2BA - 31 tpi, .196" clearance)
6BA - approx US #4 (6BA - 48 tpi, .116" clearance)
8BA - approx US #2 (8BA - 59 tpi, .0935" clearance)

The now defunct "New Frontier" column carried this very information
sometime during the last year (I can't remember exactly when). See -
it was useful sometimes....

<<New FCC rules will require the cable company to conduct routine leakage tests beginning next July.>>

<...They will be responsible solely for leaks on their main cables. Each SUBSCRIBER would be responsible for leaks from the cable entry onto their property...>

Someone in our group is building a house, and the contractor told him to go down to Radio Shack and buy the CATV wire. After the contractor installed it (but before sheet rock, thank goodness!) the building inspector made them rip it all out and replace it with something that cost several times more, and was not available from RatShack.

Sorry about the lack of details, but it looks like your local building inspector may be the last line of defense for new dwellings. (Of course, how many people get their cable inspected when they retrofit it themselves? I can bet RatShack isn't going to warn them that their cable doesn't meet leakage specs!)

Subject: Re: 10 meter rigs
Newsgroups: rec.ham-radio
In-Reply-To: article <562@hardy.NBI.COM> of Tue, 6 Jun 89 04:21:49 GMT

Harlan...
The RadioShack 10m rig is the Uniden chassis with a lot of parts missing
that make it cost RS less to purchase so they can sell the box for more than
most Uniden outlets sell the complete box for.
Basicaly, what I have heard is that the rig is as good as any CB unit made,
well, in fact it is nothing more than a fancy CB rig!
If I had any money, I'd have already purchased the Uniden by now but that's
what happens when you get too many hobbies.
I guess that I'm holding out for a "real" rig that I might find at the next
Bolder swap fest even tho it might cost me a little more and not have FM in it.

Oh well!
73's John Wells WA0LHB in Ft Fun, Coloradio

****

PS
It's cheeper to go out and buy a modified SSB cb rig and a linear than
mess around with the ten meter stuff.
But then again ch 19 (from whince most all smokey reports eminate) is AM.

Back in about 1973 we bought a bunch of HT-200 walkies that had
been in Viet Nam and were equipped with black-colored metal parts
instead of the normal chrome - presumably so they wouldn't glint
and get shot at.

Being typical hams and wanting nice shiny radios, we bought new
case parts from Motorolski and thus had all these old grungy looking
cases left over. I later rigged them to key on a red LED when
the PTT button was pushed and rented them to a local film production
unit. They even bought one for $50 to back a car over for one shot.

Look, movie companies don't want a working ("practical") radio in
shot for several reasons. The transmitter keying on makes a loud
thump in the sound recording, the soundman doesn't want a
badly-distorted radio voice that he's supposed to record (it's
ALWAYS dubbed in later), and the probability of the squelch barfing
at the wrong moment and wasting several thousand dollars of crew
time and film is just too much to risk.

At the very least I'll wager they took the crystals out of the
walkie. Yanking one synthesizer crystal would disable the radio
but it would still look like a working model. I'd cut the speaker
leads too.

Hello

I am having trouble finding an IC to repair a VCII - MA-COM - GI de-scrambler. The IC is used in position U2 and U3 and appears to be a 10 bit DAC #SOCN 24765-1 used to supply left and right audio. The IC manufacture is AMI which I understand is no longer in business.

Does anyone have any information on where this device or a substitute can be purchased.

Thanks for any information.

Mick Beilman AT&T Information Systems,
Denver, Colorado. (303) 538-2051

2327. FRG-7700 scanning

Newsgroup: rec.ham-radio

Does anyone know of a scanner attachment for the Yaesu FRG-7700 communications receiver. Looking at the schematic of the memory unit, it seems to me that the same interface could be used for a scanner. After all, the memory unit can be considered a manual 12 channel scanner in itself. Designing a scanner would take a considerable amount of time and effort, so before I even consider it does anyone know it it has already been done. I hate to spend time re-inventing the wheel.

I have heard about Mir's voice downlink from several sources, but have still never managed to hear it myself. I was wondering, since the Russians use a worldwide system of tracking ships instead of ground based stations or relay satellites, do you have to be fairly close to the ocean to hear Mir? I have absolutely *no* special satellite antennas so am limited to using a whip antenna on an HT, although I do hope to build a turnstile antenna soon.

Should I be able to hear the downlink with these constraints? I am only 50 miles inland from the Pacific Ocean but I have no idea how much power the cosmonauts are using or where their tracking ships usually are.

Also, does anyone know how wide the 143.625 FM downlink is? I've heard it is a bit wider than standard narrow-band FM.

Please reply by email to any of the addresses below. Thanks and 73!

Sounds like this is deteriorating more into a discussion
on the merits of blow-'em up movies than ham radio. I
think we are all agreed that when it comes to technical
accuracy & radios in Die Hard, it bites the dust big time.
[of course, if the producer had been from UCLA... :-)]
Still, if you ignore the downfalls & treat it more as
the take-out-your-agressions type of entertainment that
it is rather than as a carefully thought-out, intellectually
stimulating movie, then it is fun to watch. I like
my Icom 32AT. :-)

I suppose that this *really* does not belong in r.hr, but it 'is' related
to RFI, so here goes...

As a senior in high school, I took an 'honors-level' class which required a
project in order to get the honors grade. My dad was involved in electronic
music at the time, so I decided I'd write a program to 'do' electronic music
(ha! little did I know at the time!). Make a long story as short as possible,
lets just say that I never suceeded in doing it myself, but there was this
nifty program for the IBM 1130 (YES! the old super-klunker 1130 itself!
cards and all!) which did single-voice music. I would love to have
heard 4-part harmony! The technique was the same, too, tune a radio
carefully, etc... (And thus was launched my career in computers, changing
my planned major from hardware to software in one short year (or less))

At times I would have fun just sitting listening to the computer when
it did normal jobs, too. The printer sound was hilarious. (Ker-Bong!
Ker-Bong!)

The heck with the radio -- knowing what I do about production, the only thing that worked on it was the LED. I haven't kept up with the newer high priced "state-of-the-art" radios ('cause I can't afford 'em) and probably could tell a Kenwood TH-??? if I sat on the durned thing. My IC-2AT, vintage 1980 works quite nicely.

My though in Die Hard was that i wished I had faced such lousy shots in Viet Nam. Bruce was good enough to 'knee-cap' one fella with those grease guns they were using, but the bad guys couldn't hit anything. They had to try to scratch him with plate glass windows.

>specs!)

Jan,

I suspect this incident has more to do with kickbacks than with technical
issues. The building inspector would be the last one to make a technical
determination regarding a brand of cable. Giving them the benefit of the
doubt, I suppose the inspector could have noted that non-plenum rated wire
had been used in a duct or above a suspended ceiling. More likely,
the supplier of the required cable "entertained" this inspector on
regular intervals. I know from personal experience that this stuff goes
on. I've even had inspectors tell me outright that a small "gratuity"
would greatly smooth my inspection. I hate to sound so cynical but
my experience has shown that I'm probably right.

For the record, Radio Shaft CATV coax is more than adequate. It has 100%
foil shielding and a few strands of steel wire for continuity. It is
distinctly different than the cheap crap sold to CB-types under the
guise of RG-58 or RG-8.

Hello OM's,
I got a letter from Mervin ZL1AKX, Vice President of NZART, included a photocopy of a letter to the NZART Liaison officer ZL2AMJ.
Mervin asked me to distribute the information, so I copied this letter for you:

10 August 1989

Mr J F C Johnson RFS Head Office
NZART Liaison Officier Bowen State Building
15 Field Street Bowen Street
UPPER HUTT WELLINGTON (New Zealand)

Dear Sir, REG 3/1 DJJ SNT

OPERATION BY VISITING LICENSED AMATEURS

As you know, I announced at your recent Annual Conference that we would issue a policy statement concerning short-term amateur visitors to New Zealand.

I am pleased to advise that the policy as agreed is being circulated to RFS Field Offices and is effective forthwith.

The policy conditions are:

(1) Licensed visitors may use VHF/UHF handhelds on frequencies 144 MHz and above.

(2) Operation is for a period not more than 4 weeks.

(3) No application need be made and no fee is charged.

(4) The visiting amateur must be the holder of a current licence issued by their own administration.

(5) A copy of the current licence must be carried while operating and be available for inspection.

(6) Usage of the apparatus must conform with the requirements of the NZ Radio Regulations 1987 and the general terms and conditions shown on the amatuer licence schedule.

(7) The visiting amateur must use the home callsign suffixed by ZL 1, 2, 3, 4 as appropriate.

I would be grateful if you would promulgate this information in such a way that intending amateur visitors to New Zealand may avail themselves of the facility.

Yours faithfully

(D J Jenner)

Because this information is very new, I also post it to the American Usenet.

Best 73, Fritz DF2RF

I would most strongly disagree. I have had an Alinco ALR-206T in my Jeep CJ5 for almost a year now. A Jeep is not what you call an Ideal environment! They are full of dust, vibration, and general overall abuse on electronics. Yet the Alinco has yet to even hicup.

I purposely purchase the Alinco due to the fact it was a simpler radio than the "Other Three's" products. I figured the simpler the less chance of failure. The other reason for the Alinco was it's superior cost value. I think I purchase a radio with much more value going for it at less than half the price of Yaesu, Icom, or Kenwood.

> - Stick with Icom, Yaesu, and Kenwood.

Try Alinco, you may be pleasantly surprised!

> ewb@raybed2.ray.com

It's funny you should ask about this--right now I'm working on my PRO-67 (PRO-57 with 40 meters added). I have comments both good and bad about the antenna.

First of all, this is a LARGE and HEAVY antenna. I had forgotten just how large and heavy until we took it down for some work this weekend. Mosley uses double wall tubing in the middle (reduces sag) and the PRO-67 weighs in at about 98 pounds! I understand that the PRO-57 weighs in at 86 pounds. Not an antenna for the meek of heart. You need a husky rotator with this antenna. Alliance HD-73s need not apply. I had used one of these initially and it suffered damage after about 2 months of New Jersey winters and failed completely after 6 months.

I have found the performance to be quite good. For example, with the antenna installed at 56 feet, I had no trouble working the Vietnam DXpedition last year. Except on 40 meters, the front-to-back and front-to-side ratios are very good--so good that I've occasionally thought the band was dead when, in fact, I merely had it pointed 90 degrees away from the opening. So, gain and directivity seem to be good.

Now, a little bit of bad news (my opinion anyway). One of the reasons I bought this antenna was because it was supposed to be broadbanded and my TS-940S likes to turn down the power very quickly with SWR. Mosley had published SWR curves that showed 1.5:1 or less across 20, 15, and 10 meters, and 1.6:1 or less across 40 meters. Since the 940 turns down the power to 65-70 watts at 2:1 this looked like just the antenna for me! Unfortunately, Mosley's SWR curves are greatly optimistic. I see 2.5:1 on 20 meter CW, for example. In fact, this is one of the reasons for the antenna work this past weekend. I fully expected that I had assembled the antenna incorrectly and gotten a trap in backwards. Well, such was not the case. I disassembled all the traps and found them to be exactly as Gary, K0VUW, of Mosley had described. Measurements were checked and all were found to be with 1/4 inch. The bottom line is that

the antenna is just not that broad. Sigh.

I understand that (eventually) Mosley is supposed to have a modification kit available that will improve SWR, but only on the WARC bands. Yes, this antenna is supposed to work on 17 and 12 meters. However, they have been promising the modification since April and it isn't ready yet.

I would be curious to hear from others who have used the PRO to see if my experience is the norm or a 3 sigma point. :-)

>Surely you must contact at least TWO hams to take your novice exam these days.

No, not as such. You go to the place the VEC is giving the exams, and
they give you and anyone else who walks through the door the exam. No
social interaction required. You pays your money and you takes your
test.

> Surely contact with hams is made BEFORE
>taking the exam, and a rig can be purchased and shipped through that contact
>well before that time.

No, not that either. I studied on my own. I know many people
who have done the same. We may be a minority. I kind of doubt it, since
I don't know *anyone* who has had an Elmer per se, i.e. a non-related
person who taught them.

But what's the extention of this new law of yours? Does the guy who
gets MY radio assume liability for what I do with it until my license
arrives? If I decide I don't want to be a ham, does he confiscate the
set? Do I have recourse against him if he decides not to give my radio
to me?

Fortunately, there is no basis in law to take this idea beyond the
pointless network discussion phase.

<our news feed has been broke so this may be a bit behind>

I have both the Larsen 2/70 and an Austin 500C Dual Band and I really reccomend the Austin. It is less than half the size of the Larsen and the performance is comparable on 2 meters and better on UHF. Since UHF is my band of choice I far prefer the Austins.

There is also a tri-band (2m-220-440) and triplexor version of the Austins. They also make this antenna for commercial/govt services. I am thinking of getting one of these for scanning.

Austin Custom Antennas is in Sandown NH. I can't find the number now...

What makes an Engineer? Yes i agree with most of the previous comments
on this subject. Too many of the modern 'engineers' are lost without their
CAD systems/calculators/simulators. They dont understand that the machines can
only give the right answer if you know the right question in the first place!
(I have seen people using a circuit design package try to divine L-C tuned
circuit parameters, fail to appreciate that you give values in Megahertz ,
not Hertz, and be somewhat perplexed when their computer insists that they
need a 17 FARAD capacitor across their coil....)
Such types dont like it when the rest of the lab degenerates into
uncontrollable, incontinent mirth as a result. They tend to go off in
a huff and wont talk to you for the rest of the week, their pride has
been wounded...
Those of us who dont have the technology to hand, use 'quick guess'
formulae (1.5picofarads per meter of wavelength is a good starting point)
and get within 5% of the computer-generated answer in most cases!

As to whether having a list of degrees/PhD's as long as your arm makes you
employable - i would say emphatically NO!!
Most of the people who work for our computer section are excommunicated
botanists, lapsed nuclear chemists, unfrocked geologists etc. who can look
at 15000 lines of FORTRAN program and spot the bugs. The 'Computer scientist'
types can solve 'Rings of hanoi' puzzles and discuss the merits of
different disk-cache algorithms, but they can't solder a 25-pin 'D'
plug to a modem lead, or attach 'N' connectors to Ethernet cable!

Its because of the 'non-real-world' designers who inflict their products on
us that we have LCD displays that cant be read in bright sunlight, frequency
synthesizers with appalling phase noise, and non-linear linear amplifiers!

Competence cannot be taught, it has to be learned. If this involves a few
mistakes, so what? The best discoveries happen by accident!

Hmmm... I didn't have any Elmer. I was glad that AEA sold me an HT
prior to my getting licensed, so I could find out where the exams were!

>
> Surely you must contact at least TWO hams to take your novice exam these days.

But if you start at Tech, General, Advanced, or Extra, you don't need to
know anyone. As in my case. As in the case of several local hams.

> [...]
> Surely contact with hams is made BEFORE
> taking the exam, and a rig can be purchased and shipped through that contact
> well before that time.
>
> --Phil howard-- <phil@ux1.cso.uiuc.edu>

The problem with all this is that it is not illegal for non-hams to own
gear, nor is it illegal to use it as a receiver. I know of several
people who passed their 5 wpm exams because they were able to listen to
W1AW at night.

Some think that non-hams shouldn't be able to own transmitters or
transceivers. They would have prospective hams buy receivers, get their
licenses, try to sell their receivers, and buy transceivers... This
hobby is too costly for the newcomer as it is, without assessing this
sort of penalty...

There was a fascinating short article about Voyager 2 in last month's Wireless World (July 1989, pp 648-649).

"All data is sent in digital form, slowed down where necessary
by means of a belt-driven magnetic tape drive."
==============================

That's what it says.

After a few years of relying on our local club station for HF airtime, I am finally breaking down and buying my own HF rig (yes, let's hear those sounds of rejoicing among net-dom). I've firmly decided on the Kenwood TS-440S, after looking at many radios and analyzing what I want to do with such a rig, so PLEASE don't send mail or post anything about what a bad choice I'm making or persuading me to try your favorite other rig or brand. What I WOULD appreciate is any information about the radio from other owners/users of the TS-440S: particularly, things such as handy modifications, info about the IF-232C/IC-10, other accessories, and how you feel the AT-440 Automatic Antenna Tuner works. Also, which IF Filters did you find best for working CW, SSB, and RTTY. Anything that anyone can send would be greatly appreciated. Please send to any of the following addresses (listed in prefered order):

FRANKB@CLEMSON.BITNET
LIETUVA@PRISM.CLEMSON.EDU
DISD@HUBCAP.CLEMSON.EDU or ...!GATECH!HUBCAP!DISD

Thanks much!! And, God and my fiancee willing, I may be able to get on the air more (and, perhaps, could it be, possibly work CW????).

| monthly fee?

I think right now this is policy rather than regulation, although it
may be becoming regulation. Our CC lets you have drops with no extra
charge, and they frequently have a $20 installation fee to put it in.
For $20 I'm willing to let them do it, rather than get the hardware,
install it, and clean up everything afterward.

If it's just a run through the wall no problem, but when I wanted
cable on the 3rd floor I them play with it.

Someone posted a message that lots of GIF's (including the latest
neptute and triton pictures) from their machine. I think it was
grape.ecs.clarkson.edu. Anyway, I ftp's there and went into binary
mode and got a bunch of pics. But when I ftp's them down to the mac
(I was in binary this time, too), it (Vision Lab) either opens a
solid black screen (i.e., pictures mapped to an apparently-synthesized
all-black CLUT) or it complains about bad LZW codes or early EOF's.
The bottom line: the GIF's are either corrupted or I'm doing something
wrong. I'd like to believe it's the second thing, but since I've tried
numerous ways of doing this, I'm afraid that it might be the first
(though I find this hard to believe).

Would someone (perhaps the person whose machine this is) care to
enlighten us about what format it is/how we shoulf ftp it/anything
else which is important...?

2353. Not ANOTHER Special-Interest Newsletter

Newsgroup: rec.ham-radio
Date: 1989-08-29 22:45:53 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <8908292245.AA04048@cmr.ncsl.nist.gov>
Source record: 17182

It has been suggested that a special-interest newsletter is the answer to the loss of the QST The New Frontier microwave column. NO NO No No no no !!!! As Bob Atkins correctly points out --- THE REAL NEED IS FOR MASS EXPOSURE FOR MICROWAVE ACTIVITIES. Also, in addition to my interest in narrow-band, weak-signal acitivities, we need the "mass market" wideband, big signal usage. The narrow-band folk will never use enough of the microwave bands, they just use the band TOO efficiently.

As a start, let me suggest that the mass ownership of video cameras has made ham TV within the reach of lots of people. One channel on 440 isn't enough. Let's get ham TV on 1240 MHz with 4 to 6 channels.

Somebody in this group will suggest high data rate digital links. (Glenn Elmore - are you listening?).

Some care has to be used, however, so that the 60 dB down sidebands of the wideband modes don't wipe out the usefulness of the narrow narrow-band segments (as in the ARRL 902 band plan). In that case they listened to the Membership Services Committee instead of the VHF UHF Advisory Committee (the people with appropriate technical savvy).

Again, 1.3 GHz isn't all of the microwave world. 2.4 GHz and higher aren't out of reach any more - cheap transverter kits are available. Given a fair antenna and a little power amplifier, and a point-to-point link (or contact with a known location) should be hard. At Jimmy's (W6JKV) yearly barbeque early this month, I understand someone demonstrated a 10 GHz sideband voice contact with a station 20-30 miles away over a ridge of hills. Don't say that the microwave bands are useless for obstructed paths. (The power involved was milliwatts).

I doubt if the building inspector was concerned with leakage of RF. He was probably more concerned with other safety aspects of the cable installation. Your local building codes (and their references such as national codes) are what he should be basing things on.

I wonder if 100% shielded cable was used to replace the RattyShack stuff.

2357. Planning to visit Yosemite?

Newsgroup: rec.ham-radio
Date: 1989-08-30 06:20:46 UTC
From: winter@Apple.COM
Message-ID: <34431@apple.Apple.COM>
Source record: 17275

Found this on packet recently. As a recent user of the new
Yosemite repeater, I can attest to its usefulness. And when
you come out of the Valley and lose 147.00, you come back
into range of its sister repeater on 147.03. It's really nifty!

I thought everyone on the net would like to know about it, since
Yosemite gets visitors from all over the world. (Like PA3AOG, who
wrote greetings in the dust of our car! :-))

73,
Patty

From: KB6DRN@K6RAU
To: ALL@USA
Subject: YOSEMITE 2M REPEATER

****
********** YOSEMITE NATIONAL PARK 2M REPEATER **********
****

August 27, 1989

Amateurs planning to visit Yosemite National Park should make
note of the new 2-meter coverage now available in Yosemite.

The Turlock Amateur Radio Club (TARC) maintains a 24-hour,
2-meter repeater system which affords handheld service in
the majority of Yosemite Valley Floor as well service to parts
of the high country.

The Yosemite access port operates on the output frequency of
147.000 Mhz (input is 600 khz up) and is open carrier access.
The access port is linked to the W6BXN wide-area coverage
multi-freq repeater system (147.030 & 444.700 located at
Mt. Bullion near Mariposa 4400ft above the San Joaquin Valley
floor) giving contact with a large population of CentralValley
Amateurs.

The new station operates from Turtleback Dome in Yosemite
and transceives directly into Yosemite Valley via an 8db beam
pointed directly into the Valley from above Inspiration Point.

The site was utilized as it has great coverage into Yosemite,
but is shaded from the San Joaquin Valley so as to keep
co-channel interference with stations in the Central Valley to
an absolute minimum.

The station was designed by K6IXA (Grady) and was installed by K6IXA and KB6DRN (Ed). The station consists of two VHF Engineering Transmitter/Receiver combinations along with a VHF 4-elememt KLM/Mirage beam and a UHF 6-element Scaa beam with associated duplexer cavities and radiates 200W ERP to the Valley Floor.

Amateur coverage in Yosemite Valley had been very minimal until now due to the enclosed geography of the Park leaving a great national facility with poor coverage for the large number of American and Foreign Amateurs visiting the Park each year.

The TURLOCK AMATEUR RADIO CLUB looks forward to meeting those traveling through Yosemite and welcomes all to make their presence known while visiting the Park. W6BXN Repeater covers the a large portion of the Central Valley from Mt. Bullion near Mariposa. 444.700, 147.030 & 147.000 are 24 hrs accessable.

Look over in comp.graphics; some people over there have announced
their availability in other formats. (Basically all these "different
formats" consist of some magic header, followed by the same old image
in bytes. That's why I like to distribute just the bytes and leave
the "header" in English. It's the most universal, comprehensible, and
elegant format, IMHO.)

P.S.: Strangely enough, among the many machines grabbing copies of
the images have been several machines at JPL.

Synchronous detection - the technique i have used is as follows:

The incoming double-sideband AM is split into two separate signals. The first is passed through a filter sufficiently sharp to greatly attenuate the sidebands (so we essentially have only a carrier) and this is used to lock the PLL.
The second signal is fed to two filters, one an 'upper sideband', the other a 'lower sideband' filter. What comes out of these filters is selectable with a switch. So now theres 3 signals available::
1) the 'new' carrier, phase-locked to the original (AM) carrier.
2) The upper sideband of the AM signal
3) the lower sideband of the AM signal.

Now you can stick one of the sidebands and the carrier into a product detector, and treat it like you would a SSB signal.
The whole point of doing it this way is that since you are only receiving one sideband, your noise bandwidth is halved, so you get the 3dB signal/noise ratio improvement of SSB. Theres also the ability to 'switch sidebands' if you get interference.
If you are really keen, you demodulate both sidebands, and then feed the two independent audio signals (in the right phase of course!) into an adder.
I think some proposal for AM stereo worked along these lines , each channel being modulated into one sideband (but how could they do this????)

Anyway, sync. detection works real nice. I use a NE561B PLL chip and three crystal filters, and a diode-ring mixer to combine the carrier and selected sideband. The recovered audio quality sure beats the 'diode and capacitor' in most AM sets.

I will be getting my first HF rig this weekend (hurrah) which will have a general coverage receiver capable of handling AM, FSK, and SSB from 100kHz to 30MHz (hurrah hurrah). While playing with my packet station on 2m last night, I realized that with the new radio I might be able to start playing around with WEFAX. I have the Kantronics KAM All Mode unit with the WEFAX update, but I've never had a radio capable of receiving the WEFAX transmissions before. Can anyone who has used the KAM before for WEFAX recommend software for a PC (not XT, not AT, but an ugly old PC clone) with 1024x768 res VGA graphics?? Any other information about WEFAX would be helpful as I've never been able to do anything with it before now. A list of frequencies and schedules would be helpful as well. I will be up at a hamfest this weekend purchasing the radio, and I'd like to go ahead and purchase whatever I'll need for WEFAX while I'm there... any help would be appreciated. Please e-mail direct rather than clutter up the net here:

I couldn't help replying to the note about sports being more important than science in America. We have been trying to get science fairs started in our local school system. One of the major objections to having a science fair in high school was that kids didn't have enough time with homework and sports taking first place. Homework I understand, but SPORTS??!! Anyway, enough of the soapbox, but I do feel that the ham community should support science fairs in any way possible. How about a station set up with packet, HF, 2m, slowscan, rtty, fast scan TV, etc... Wouldn't hurt to advertize a novice class then also.

Yes, there are jerks out there on the airwaves. Hams are people too, and you will ALWAYS find a few bad apples mixed in with the good ones. Technical competence does not rule out being a jerk, as you can see if you join any kind of special interest group. Ham radio certainly does not have more jerks amidst its ranks than the average, though. In most groups, you can walk to the other side of the room to get away from it. In ham radio, though, they broadcast themselves to the world. The result is that some potential new ham, "cruising the band" with his SW receiver hears it, and if he just hears one jerk on the entire band and that one person makes enough of an impression, he will begin to associate the whole of ham radio with that.

As for massive frequency "own-itis", power-muscling, and general inconsideration, from the years that I've listened to the HF bands, I've seen my share, but the mass majority of hams I've heard are polite and considerate. Much of it comes from a sense of competitiveness. Remove that and most of the "band scrambling" will disappear (good luck at that!).

About "letter of the law" vs. "intent of the law", it is a sad but true fact that the "letter of the law" and not the "intent of the law" is what you will be pinned with these days -- and that's not just in ham radio. When was the last time you speeded in your car? It may have been safe -- after all, that's why there are speed limits, for safety, right? -- but try explaining that to the judge, as they say. Personally, I am happy to see the "little stuff" like ordering pizza addressed on this net -- it is often the little stuff that most people are unaware of that you will get nailed for eventually (of course, when was the last time the FCC...?!). It may sound irrelevant, but if it helps people better understand the rules that govern our operation, then it is beneficial.

Public service -- even as I write, about half of the local ham club is out on Highway 395 helping in communications and ready to provide assistance for the Los Angeles -- Mono Lake conservationist ride. Some of these hams are even taking the day off of work, and all of them are doing it because they take an interest in what is happening in the world and because they enjoy helping others, and to me, that is what being a ham is all about. Open your eyes -- ham radio is alive and well!

Well, this reminds me of my highschool days, when I got involved in TV repair. My neighbor was a part-time (color) TV repairman, and his workshop happened to be about 20 feet from my bedroom (which was also my workshop, doncha know). When I first discovered that I could watch a fair number of cable channels I did not know all this... It was later when I realized that he used the cable to feed his TV's under test (we only had 1 or 2 TV stations in Yuma, Arizona), and there was enough leakage for me to pick up with rabbit ears (or worse :-)

I am presently using on of those walkman type radios. I am currently
listening to a local station that isnt't too strong. What I have done
was use a headphone extension cable (20',with mini to 1/4" adapter)
into good (sennheiser) headphones. I have to configure the wire in
some funny :-) shapes to reveieve the signal, after a few minutes of
hunting I can usually receive it noislessly. The local computer
equipment as well as the office partitions play havok on the rf signal.
I have found that if your relatively close to an outside wall (<50'),
it it better to put the walkman by the wall and extend the headphone
cable. This seems to be a cute little game every time the office area
gets moved around. But i need my music to drown out the other area noises.
good hunting...

I read about rumours of an upgrade kit for
Kenwood TM-621s and TM-721s that will give
them the same display as the new TM-731 hence
solving the daylight readability problem.

I read about this on a bay area packet BBS.

I went to my dealer and they too had heard
the rumours, but had no knowledge of
official intentions of Kenwood to market
such an upgrade.

Has anyone seen such a kit first hand, know
of a part or product number or have anything
official in writing from Kenwood to substantiate
the rumour?

Source record: 17195

Can you post this in info-hams or send to Roger who requested this
information? I can't get him on e-mail.

/s/ Peter J. Stopa KA3LKQ

HI ROGER!

My name is Peter J. Stopa and I am an advanced class licensee from the
state of MAryland. My call is KA3LKQ. I would like to give you the following
information on the MD ham tags. I won't use your format exactly, but I will
give the information you request.

The state of MD issues ham tags at a price of $5.00 above the cost of the
usual fees ($27.00 fee + $5.00 ham tag fee). This is the same as the cost of
vanity plates and special group plates (university alumni associations, reserve
officers, kiwanis, optimists, etc.- very long list). All plates are renewed
annually for the same fee as mentioned above. You must present a current copy
of your license when requesting the plates, but not on renewal. All plates in
Maryland are renewed with a sticker, except every so often, the state changes
its license plate design and everyone is required to get new plates. Last time was 1986;
before that was 1980. The ham plates are identical to the regular
plate, except that it says amateur radio operator. It takes about 6 weeks to
get the ham plates once they are requested.

I have seen ham plates on motorcycles, RV's and light pick up trucks. No
special privileges are given to vehicles with these plates; however, it did make it easier
to access the area of the AMTRAK wreck several years ago when the
local hams gave assistance to rescue crews. Plates are on both areas of the
vehicle.

I do have ham plates. I have mixed feelings on their utility. On the
one hand, they are good advertising for ham radio and do lend credibility to the group; on
the other hand, your car may be more prone to break-in (looking for
electronic gear), and you do lose your anonynimity. THis information is from
memory and from that which was published in the BRATS monthly bulletin. I
have not confirmed this with the DMV.

/s/ Peter J. Stopa

Good shot, Rusty! I've been working on a mixer that would take a Walkman, several ham rigs, and a scanner as input, and provide an exclusive squelch. (Any non-Walkman source active turns all others and Walkman off, and also sets key and mic to the active rig.) I wanted to hook the Walkman to the scanner antenna, but hadn't really given much thought to how. Rusty inspired me to rip open a Walkman and figure out how they do it.

All three headphone lines go through a trifilar-wound torroid choke, and the shield is connected to the FM tuner though 100 pF. Keep this in mind when hacking -- I imagine your standard headphone wire has fairly high capacity, and unless all three wires are RF isolated, your Walkman will probably see an 88MHz short.

I'd tap off close to the radio, and RF isolate the headphones with a trifilar choke to minimize local pick-up and multi-path effects. I have no idea what impedance the radio expects, although the frequencies involved and the length of the headphone cord suggest it is probably quite high. 50 ohms seems to work for me, but I have no idea how much feed-line pick-up I'm getting, and how much is actually coming from the antenna!

>much about ruffling a few feathers at the local FCC monitoring post.

Yeah, well *ILLEGALITIES* aside, and *WISDOM* of choosing a common
frequency (i.e., channel 9) notwithstanding, and *ADVERTISING* by a
well-known radio manufacturer accepted as common Hollywierd practice...

I noticed some things that bother me more...

Didja notice that (1) the badguys [or at least the head badguy] was
using the DTMF pad on the transceiver just before calling one of the
jr. badguys on a few occasions...?

Didja notice that (2) everyone, badguys (Hans), goodguys (McClain) and
dumguys (Dwayne) all seemed to *USE* the radio in FULL DUPLEX mode?
Not, mind you, regarding transmitter frequency, but regarding the
PUSH-TO-TALK function. I mean, VOX is believable, but one guy interrupting
the other, or "hearing" the other guy "hang up" like on a telephone...

THAT's what bugged me about the radio stuff. Too bad nobody on the
props (or better yet, continuity) staff knew any better... or maybe
they DID and figured nobody out here would notice.

Gee, does that mean they think we're all a bunch on morons? Or does it
mean they thought their movie was SO GOOD that we wouldn't care about the
little nits that are there, just waiting to be picked...? :-}

Could this be yet another ham bitten by the GE 6.7-volt filament fiasco? You know, it's really hard to believe GE would do something so insane--what equipment do they think people are going to put them in that would have a 6.7-volt filament supply? Sigh.

In any case, I don't know what brand they carry, but Amateur Electronic Supply carries 6JB6s for (only) $24.95 each. If you don't find a less expensive source, it's probably worth a toll-free phone call to them at 1-800-558-0411. If anybody's interested, they also have 6146Bs for $23.50 each, as well as matched pairs of certain tubes for old Swan, Galaxy, etc., plus a matched set of four 6LQ6s for amplifiers that use those tubes. Such a deal!

SILVER SPRING, MD AUGUST 20, 1989
TO ALL RADIO AMATEURS BT

Strong AO-13 Mode S Signals Heard With "Normal" Mode B Uplink Power Levels

As reported last week in a AMSAT News Service (ANS-224.01) bulletin, Peter Guelzow (DB2OS) with the assistance of ON6UG, G2BFO, and DF5DP, was able to figure out a way to shut down the Mode S beacon on OSCAR-13 during normal pass-band communications on the Mode S transponder. From the very beginning the Mode S transponder's beacon was designed to shut off when the transponder operations commenced. However, until recently this would not occur and those who wanted to use Mode S had to "push" their signals past the beacon using enormous amounts RF output power on 70cm. But with Peter's reprogramming of the Integrated Housekeeping Unit (IHU) to now turn off the beacon auto-matically, Bill McCaa (K0RZ) reports that with normal Mode B uplink power levels it is now possible to bring down an excellent signal on the Mode S transponder. Bill points out that in his testing he had excellent signals using 300-500 watts EIRP using his own Mode B uplink capability. On the downlink his signals were 10 to 15 dB above the noise floor using a 4 foot diameter dish and a 1 dB NF pre-amplifer. Bill would also like to remind OSCAR-13 users of the passband limits on the Mode S transponder. The uplink for Mode S extends from 435.471 MHz to 435.507 MHz. The corresponding downlink on Mode S starts at 2400.711 MHz to 2400.747 Mhz. AMSAT salutes the efforts of all those who were involved in getting the Mode S tranponder working properly. AMSAT encourages all OSCAR-13 users to take advantage of this new "resource."

MICROSAT LAB GROUND TEST STATION

HR AMSAT NEWS SERVICE BULLETIN 232.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 20, 1989
TO ALL RADIO AMATEURS BT

Two Complete Ground Test Stations Installed At The MICROSAT Lab

On Sunday August 10th two complete PSK packet stations were installed in the AMSAT-NA MICROSAT Lab located in Boulder, CO. The task of integrating the tranceivers, computers, and building and testing the TAPR PSK demodulators, fell on the shoulders of AMSAT-NA Area Coordinator for Colorado, Jim White (WD0E). These two complete stations will be used for testing the MICROSATs while they are in the Lab and also during thermal vacuum testing. Later, the two stations will be taken by the AMSAT-NA Launch Preparation Team to Kourou, French Guiana in October and be will used to checkout the spacecraft and make any last minute software updates. Since four spacecraft are being built in parallel and because redundancy is needed at the launch site, Jim felt that it was necessary to have two complete stations. The stations consist of a pair of 2M/70cm multi-mode Kenwood 711/811 tranceivers, MFJ 1270 TNC-2, TAPR PSK modems, two XT class computers with monitors, and an assortment of "rubber duck" antennas, dummy loads, miscellaneous cabling, and power supplies. Also, Jim had to modify the TNC's to allow for a direct connection to the MICROSAT flight computers so software uploading and testing can be accomplished without having to use the tranceivers. Many of the visitors to the MICROSAT Lab in Boulder, CO are immediately impressed with the ground station assembled by Jim. After the launch, this equipment will be used by AMSAT ground-command stations to monitor telemetry and perform daily "housekeeping" chores. AMSAT-NA would like to express its appreciation to Kenwood for donating their fine tranceiver pair to the MICROSAT program. Thanks are also in order to Heathkit/Zenith Data Systems who donated a pair of their XT-class computers. Other equipment donations came from MFJ with their TNC-2's (MFJ-1270's), TAPR for the PSK demodulators, and an assortment of "odd-and-ends" from Gateway Electronics of Denver. Without these generous donations of essential equipment to the amateur satellite program, AMSAT-NA would have to focus its scarce resources to procuring this equipment instead of concentrating on building spacecraft. Once again, AMSAT-NA wants to acknowledge Jim White for the excellent job he has done in putting these stations together and the many fine manufacturers who have helped to make the MICROSAT ground test/command stations possible.

de DB2OS 01May89: *** AO-10 TRANSPONDER SCHEDULE ***
14Jul89 to 01Sep89

Mode-B : from MA 000 to MA 255

AMSAT-NA is soliciting papers for presentation at and/or publication in the proceedings of its 1989 Space Symposium. Areas of interest include research, development, engineering, funding, construction, management and operation of OSCAR (Orbiting Satellite Carrying Amateur Radio) communications and scientific spacecraft and associated communications networks. Submissions or questions should be forwarded to: Ralph Wallio, W0RPK, CITS Chairman-AMSAT'89, 1250 Highway G24, Indianola, IA 50125. Or you can reach Ralph at the following "land-line" numbers: Home:(515) 961-6406 or Office: (515) 224-8034. On packet-radio you can send him messages via packet BBS W0AK. Also, if you would like to receive a "information" packet about the AMSAT-NA Space Symposium to be held on November 3-6th of this year in Des Moines, IA, please send Ralph a s.a.s.e. with one unit of postage.

WB6LLO suggest that those wishing to experiment with packet on AO-13 should look for him using PSK on the following frequencies:

Mode B-145.870 down, approx. 435.530 up

Mode J-435.950 down, approx. 144.460 up

WB6LLO mentions that if you are having difficulty "connecting" with him that you can meet him up 10 KHz for a voice contact, that is, on Mode B at 145.880 MHz or on Mode J at 435.960 MHz

MICROSAT PROJECT UPDATE,I

HR AMSAT NEWS SERVICE BULLETIN 232.04 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 20, 1989
TO ALL RADIO AMATEURS BT

AMSAT Microsat Project Update

Major progress is reported this past week on all fronts in the Microsat project. The most troubling problems faced by the engineering teams have been the incredibly complex computer model we have chosen for the mission. The past seven days saw a working flight computer go into operation and plans for finishing out the remaining computers are being laid into place. A fine team of people at Qualcomm, Inc. in San Diego consisting of

Franklin Antonio N6NKF
Tom Lafleur KA6IQA
Mike Brock WB6HHV

all from Qualcomm along with major Microsat/UOSAT software developers

Skip Hansen WB6YMH
Harold Price NK6K

from Quadron Service Corp.,

Paul Williamson KB5MU, a local amateur, SANDPAC president

Lyle Johnson, WA7GXD, TAPR and AMSAT member and designer of the flight CPU along with

Chris Williams, WA3EPD
Bob Argyle

from Weber State who came with the Webersat experiment module saw the first flight computer in full operation. By Sunday afternoon, Aug. 20, CCD camera pictures were being shot and sent `down' through the AX.25 software incorporated in the kernal operating the spacecraft CPU. All 8 megabytes of flight memory boards have now been debugged and the flight computer has seen several days of operation without a failure. The memory boards, packing 8 megabytes of memory in a few cubic inches, have passed extremely rigorous tests after minor patches were made to the boards to take care of manufacturing errors. The spacecraft software kernal has been excercised and the control hardware, known to us as the AART board, which is a little local area network (LAN) has been excercised and has successfully controlled the camera module and experiments. The approach to software for this spacecraft, which was to choose a commercial kernal, suitably modified for the spacecraft and to write code in a standard high

level language were also proven. It took less than an hour from start to finish to integrate the kernal and the application controlling the camera and to have it sending down pictures on the AX.25 link.

MICROSAT PROJECT UPDATE,II

HR AMSAT NEWS SERVICE BULLETIN 232.05 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 20, 1989
TO ALL RADIO AMATEURS BT

AMSAT Microsat Project Update, II

In Boulder, Co. at the clean room and AMSAT labs, the main body of the satellites proceeded toward final integration. Many people were there in force led by AMSAT VP engineering, Jan King, W3GEY in putting the main parts of the satellite into the final state. Many milestones have been reached; so many that we will list them in summary form only.

All transmitters with the exception of the back up transmitter for DOVE are closed out, functioning as planned. There is a minor instability in the backup DOVE transmitter that will be solved in the next few days.

The first complete receiver from W3IWI and W4PUJ has been received in Boulder. W3IWI reports that the second will be shipped on Monday and the last of the four receivers will be shipped to Boulder for integration on Wednesday.

All four of the vitally important Battery Charge Regulators from the ARRL lab team led by KE3Z, Jon Bloom, have been integrated with the batteries supplied by the team led by Larry Kayser, VE3PAZ and the functionality is verified.

All solar arrays are finished and the top plates are finished.

All antennas are finished and the matching networks are all tuned. The worst case mismatch yields a 1.05 to 1 SWR.

All the IR sensors are mounted.

The LUSAT morse beacon experiment is finished and is totally integrated into its module.

All AART boards (the LAN control network for all modules) are finished and functionality verified.

N4HY, Brooks KB2CST and Pat KA2MOV are finished with the DOVE experiment. Brooks Van Pelt, KB2CST is finished with the 68HC11 loader which will be flown to control the experiments in the DOVE box. This unit will be shipped this coming week to Boulder for integration into the module. The S band transmitters are already mounted in the box along with a bare DOVE board, shipped earlier in the week for fit checking.

Jan reports that the last items needed will be manufactured not later than Wednesday.

Bob, N4HY will travel to Boulder on August 27 to begin two weeks of extensive testing of all satellites and finalizing of the control and telemetry software and to prepare for thermal vacuum tests at Martin Marietta which begin on September 9 and last for four days.

Expect weekly updates from now until launch which is now scheduled for November 10 of this year.

MICROSAT TESTING SCHEDULED

HR AMSAT NEWS SERVICE BULLETIN 238.01 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 26, 1989
TO ALL RADIO AMATEURS BT

Martin-Marietta To Donate The Use Of Facilities For MICROSAT Testing

This week the Martin-Marietta Astronautics Group (MMAG) of Denver, CO informed AMSAT-NA officials that it will donate its facilities for the testing of the four MICROSAT satellites scheduled to begin September 9th and finishing on September 22nd. AMSAT-NA will have the use of a 5 ft diameter by 10 ft long thermal vacuum test chamber for five days in order to "space" qualify the MICROSATs. All four of the MICROSATs will be mounted inside the chamber and will be tested in a simulated space environment, that is, in a "vacuum" and between temperatures from -20 degrees C to +55 degrees C. During the five day test, the chamber temperature will be "cycled" from hot to cold with 12 hour "dwells" at each of the temperature extremes. These "dwell" periods will provide an opportunity for the MICROSAT test team to see how well the entire spacecraft will perform. Also, all RF and power cabling will be routed to the outside of the chamber using special "feedthrough" connectors. With the RF cabling for the transmitters and receivers available for each of the MICROSATS, additional cabling will be provided to connect the MICROSAT trans-ponders to antennas that will be mounted on the roof of the ten story Space Simulation Laboratory (SSL) building at the Martin-Marietta plant. Installed specially on the roof of SSL building for the MICROSAT testing will be a collection of 2M and 70cm antennas. Located a mile north of the SSL building is the Martin-Marietta amateur radio club hamshack which will become for a week the MICROSAT command, control, and test "monitoring" center. From this remote location, all telemetry monitoring and vehicle commanding will be performed. Another unique aspect of of this arrangement is that the OSCAR satellite enthusiasts in the Denver area will be invited to participate in this testing. At specified times, amateurs in the Denver area will be allowed to use the MICROSATs as if they were on-orbit! Through the efforts of AA0P and WD0E, no less than a dozen stations will be ready to "hit" the PACSATs simultaneously with packets using TAPR PSK demodulators connected to their packet radio stations and their OSCAR-13 Mode B equipment. While the thermal vacuum test is in progress, the members of the Martin-Marietta radio club will

be acting as hosts during the many long hours that the AMSAT team will be putting in to support this vital test. Also, a considerable level of technical, engineering, and logistical support, will be made available by club members and company employees. Jeff Ownings (N0IZN), President of the radio club at Martin-Marietta says that on behalf of the members of the club: "We are honored and privileged to once again support the AMSAT organization during thermal vacuum testing." When the thermal vacuum testing is completed on September 16th, the MICROSATs will be taken back to Lab in Boulder for further testing and to install "flight" cables. Then the four satellites will be taken back down to the Martin-Marietta plant and each of them will under go three axis vibration tests from September 19-22nd. The "shake" test, as it is commonly referred to in the aerospace industry, will simulate all the vibrations that the MICROSATs will see during launch. Once the vibration tests are completed, further testing will be done at the MICROSAT Lab in Boulder to see how well each of the MICROSATs did during the vibration tests. Both of these tests, thermal vacuum and vibration, are required by Arianespace before the MICROSATs will be allowed to fly with the SPOT-2 satellite aboard the ARIANE IV rocket on November 10th.

This is the second time Martin-Marietta has offered the use of its test facilities to AMSAT. Many AMSAT members will remember that this was done three years ago when PHASE-3C (now known as OSCAR-13) went through final assembly and integration in the Denver area during the spring of '86. At that time Martin-Marietta provided the very same thermal vacuum test chamber so that all the subsystems on PHASE-3C could be tested.

AMSAT would like to again express its deepest appreciation for the continued support that Martin-Marietta has provided to the amateur radio satellite program over the past several years.

MICROSAT PROGRESS REPORT #6

HR AMSAT NEWS SERVICE BULLETIN 238.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 26, 1989
TO ALL RADIO AMATEURS BT

MICROSATs Moving Toward Final Assembly & Integration For Full System Testing

With the September 9th thermal vacuum test only two weeks away, the AMSAT-NA MICROSAT Lab in Boulder, CO is a "hot-bed" of activity. Through out this week and culminating with the thermal vacuum test, AMSAT volunteers will be flying in from around the country to help complete the final assembly, integration, and testing of the four MICROSAT satellites. So great is the progress being made that almost any Progress Report issued by AMSAT HQ's will be out-dated very quickly. But there are several significant milestones which have been met recently which deserve to be mentioned.

1. All four of the 70cm receivers designed and built by Tom Clark (W3IWI) have arrived at the Lab this week and are ready to be integrated.

2. Last weekend at Qualcomm in San Diego, the first flight computer was completed and tested thanks to the "heroic" efforts of Bob McGwier (N4HY), Franklin Antonio (N6NKF), Tom Lafleur (KA6IQA), Mike Brock (WB6HHV), Skip Hansen (WB6YMH) and Harold Price (NK6K). Also present and working to get the first flight computer running was Lyle Johnson (WA7GXD) and Paul Williamson (KB5MU). A special "tiger-team" was flown in from Utah to Qualcomm that consisted of the Weber State University team of Chris Williams (WA3EPD) and software expert Bob Argyle. The Weber team brought the CCD camera module with them for checkout with the computer. This first computer was completely checked out and will be arriving sometime next week. The WEBERSAT CCD was also successfully tested and all the processing was being performed by the first "production" flight computer.

3. In the "make-shift" clean room in the MICROSAT Lab all the modules, solar panels are ready to be integrated into spacecraft. A lot of "odds-and-ends" hardware tasks are still being performed. All the antennas have been built and tested along with the matching networks that will go with them.

4. The DOVE transmitter instability was resolved through the "tireless" efforts of Jose Machao (LU7JCN) of AMSAT-LU. Jose has virtually "lived" in the MICROSAT Lab for the past ten months. Also, Jose has tested all the transmitters and declared them "ready for flight." Joining Jose until late into the night has been AMSAT-NA VP of Engineering, Jan King (W3GEY). Jan says that based on his experience with passed OSCAR satellite programs, this final "push" to get the satellites assembled, tested, and ready for shipping is always the most "stressful" period.

5. All four of the Battery Charge Regulator (BCR) modules have been completed. This was a particularly difficult task for volunteers due to the small space size available to fit the eight batteries and the BCR circuit board into a 1.5 inch thick module. The BCR electronics was designed and built by Jon Bloom (KE3D) of the ARRL. The final testing of the BCR modules will be completed by this week. Special thanks goes to Larry Kayser (VE3PAZ) who supplied all the batteries to AMSAT-NA for the MICROSATs.

6. All the AART control boards have been completed and will be checked out by Chris Willams (WA3EPD).

7. The DOVE voice speech synthesizer hardware has been completed by N4HY, KB2CST, and KA2MOV. This hardware will be shipped to Boulder next week for integration into DOVE. N4HY has been also working on the voice software which needs to accompany the speech synthesizer.

8. The S-Band transmitters which were built by YT3MV have been integrated in to the "spare module" in DOVE and the AMSAT-NA PACSAT. The S-Band trans-mitters have been checked out and produce about 1 watt of RF output.

9. N4HY will travel to Boulder on August 27th to assist in the assembly and testing of the satellites; he also will be present throughout thermal vacuum testing. Bob will also be finalizing the MICROSAT software for commanding and monitoring the telemetry for the thermal vacuum testing at Martin-Marietta. Joining the volunteers in the Lab next weekend will be Junior De Castro (PY2BJO) of BRAMSAT who will be assisting during this critical phase of the

MICROSAT testing.

In any Progress Report it is almost impossible to mention the names of every volunteer who has helped to contribute to the progress of the MICROSATs during any week. But AMSAT-NA truly appreciates all those who have volunteered their time and engeries to make the MICROSAT program possible. With the intensive testing period beginning soon, many a volunteer will be working long hours to help make the testing a success. The radio amateur community can proud of what these "tireless" volunteers have produced.

TENN BALLOON LAUNCH A SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 238.03 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 26,1989
TO ALL RADIO AMATEURS BT

Tennessee Balloon Launch Was A Great Success

Carl Lyster (WA4ADG) and David Fields (N4HB0) report that their first balloon experiment was launched from the Knoxville, TENN area on August 5th and the flight was very successful. Many will remember that two weeks before their balloon launch had to be "scrubbed" because of a faulty +5V regulator which was critical to the telemetry system. This balloon launch was particularly interesting because the 2M beacon contained a voice synthesizer reproducing the voice of Astronaut Neil Armstrong and the famous words he spoke as he stepped upon the lunar surface. Also, there was a beacon on 10M which sent out ASCII telemetry. The balloon was launched exactly as planned at 7:29 A.M. EDT on a beautiful sunny day. Assisting in the "pre-launch" net was WA3USG who ran the 40M phone net and received check ins from as far away as Michigan. It was estimated that the balloon carried its payload to an altitude of 90,000 ft. Stations as far way as 450 miles reported hearing the beacons. After one and half hours of flight, the balloon burst and it took almost 30 minutes for it to safely parachute to earth. Once the balloon burst, a Civil Air Patrol (CAP) plane carefully tracked its decent and kept the package in site until the ground crew could reach the tree that the package landed in! Always an adventure, the ground-crew had to extract the balloon package from the top of a 70 ft tree. But with perserverance, the ground crew finally retrived the payload. With the success of this balloon experiment, WA4ADG and N4HBO are now planning their next experiment. Their next effort will be a 10M-to-2M translator which they hope to launch in about 2 months. AMSAT congratulates both Carl and David on their success.

AMSAT SHORT BURSTS

HR AMSAT NEWS SERVICE BULLETIN 237.06 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 25, 1989
TO ALL RADIO AMATEURS BT

AMSAT Short Bursts

Bill McCaa (K0RZ) reports that the activity on the OSCAR-13 Mode S transponder is quite heavy. Many stations have been experimenting with QRP power on the 70cm uplink and have reported excellent signals using 2-3 watts from their Mode B antennas on CW. For SSB contacts, it takes about 10 watts of RF output from a good Mode B station. All OSCAR-13 users will be suprised at the excellent signals on Mode S, this according to K0RZ.

The following is the latest OSCAR-13 operating schedule. Please post this in a convenient place in your hamshack for quick reference.

AO-13 Transponder Schedule
16Aug89 until 16Nov89
BLON/BLAT 210/0

Mode B: MA 003 to MA 160
Mode JL: MA 160 to MA 200
Mode B: MA 200 to MA 240
Off: MA 240 to MA 003
Mode S: MA 210 to MA 222

Through the efforts of Sumio Nakane (JH3BJN), AMSAT-NA has received the following operating schedule for FUJI-OSCAR-12 for the next few months:

DATE MODE OPERATING PERIOD

09/02/89 JA 22:37 UTC until 06:49 UTC on 09/03/89
09/05/89 JA 21:57 UTC until 06:00 UTC on 09/06/89
09/08/89 JD 19:15 UTC until 03:27 UTC on 09/09/89
09/13/89 JA 18:48 UTC until 03:00 UTC on 09/14/89

PLEASE NOTE: NO FO-12 OPERATION FROM SEPT. 15TH
TO SEPT. 25TH DUE TO SOLAR ECLIPSES!

09/26/89 JA 15:12 UTC until 23:24 UTC
09/30/89 JD 21:50 UTC until 12:44 UTC on 10/01/89
10/06/89 JD 20:29 UTC until 11:23 UTC on 10/07/89
10/10/89 JA 10:42 UTC until 18:54 UTC

de DB2OS 01May89: *** AO-10 TRANSPONDER SCHEDULE ***
14Jul89 to 01Sep89

Mode-B : from MA 000 to MA 255

WB6LLO suggest that those wishing to experiment with packet on AO-13 should look for him using PSK on the following frequencies:

Mode B-145.870 down, approx. 435.530 up

Mode J-435.950 down, approx. 144.460 up

WB6LLO mentions that if you are having difficulty "connecting" with him that you can meet him up 10 KHz for a voice contact, that is, on Mode B at 145.880 MHz or on Mode J at 435.960 MHz

Source record: 17201

SB ALL @ ALLBBS $KT7H0830
Guemes Is. on this weekend!

Packet BID: $KT7H0830

Just a reminder...my new country application has been submitted to
the ARRL, and KT7H will be on the air from Guemes Island beginning
Friday, September 1, around 2100 UTC.

Look for us first on 20 mtr SSB, and later on all HF bands and modes.

In case you missed the earlier bulletin, Guemes Island and Tatoosh Island
are in water off Washington State, and should qualify under DXCC rule 3B,
because of British Columbia's intervening territory. I have searched the
rules, and can find no feature of the DXCC rules that would prevent these
islands from becoming new countries. To check the rule, see April 1988
QST, page 84, rule 3B.

I have received some negative comments concerning the filing, but no one
has yet been able to point to any specific aspect of the DXCC rules which
negate the clear criteria of 3B. DXAC is working on another revision of
the new country criteria, but there were no new criteria established as of
the date of my filing.

73,
Tad

Would you like a mobile antenna for 2 meters that requires NO drilling of the bodywork of your shiny new automobile, NO stick-on-glass mounts, and makes NO indication to the local criminals that you have ham gear on board?
You would?
Well, between 1986 and 1987, research in the UK was carried out for the various police forces, into using the heated rear windshield elements as an antenna. It was found to work quite well. OK, its a couple of dB down on a whip in the middle of the roof, but it does avoid the need to drill holes (a definite plus point if your vehicle is leased to you or supplied as part of your employment).

All you need is an appropriate matching network and access to both ends of the heating element. The matching network is simply a couple of L-C networks and a length of coax. It will handle 25-watts quite happily. Tests have shown that the R.F. field strength inside the vehicle is not hazardous at the 25-watt transmit level.
The only problems you might encounter are that some vehicles have the heater elements running very close to the rubber window seals (they arent actually rubber, they are carbon-loaded plastic - with very odd dielectric properties) and if you happen to have a rear wiper, then the blade and/or arm may be the cause of odd resonances and detuning.

Tests with the 'thing' in comparison with a 1/4 wave whip in the centre of the roof show maybe a 3 dB reduction in performance, BUT because few of us have antennae in the centre of the roof, this is not too much of a problem. OK those of you with triple 5/8 waves might tell the difference.

For those of you who want to try it out, now is the time to go looking in your junk box.
Find, borrow, steal, or if all else fails, BUY, these bits::

Two 100pF airspaced variable capacitors
One 4.7pF 1Kv working voltage ceramic or mica capacitor
Three feet of 16 gauge wire (note thats BRITISH 16-gauge, i've lost my tables that convert to US wire gauge!)
One small (6 inch by 3 inch by 2 inch) diecast aluminium box
Two BNC plugs and sockets.
One yard RG58 coax.

And stand by for the next episode - coming soon!

AMEN!!
Besides, ATV on 420 is also trashing other users of that frequency
range, often without knowing it.
While we're getting ham TV up there, let's get manufacturers to include
a VSB filter standard. There's no place for 15 MHz signals where 6 MHz
signals will do.

Bob
Yes, I'm listening. Look for a description of an inexpensive multi-megabaud 10 GHz data link in the December Ham Radio magazine. In addition there will be some details at the 8th Computer Networking Conference in Colorado in October (I'm still working to get that darned 'computer' out of the title).
I might note that sidebands from a wideband source are not really the problem at microwave (assuming reasonable physical antenna size/gain) that they are lower. This is why all the PTTs around the place get away with reusing channels.
Also I hope to have some 900 and 1200 MHz 250-500 Kbaud radio hardware to publish before too long.

2383. Using the net when mail fails

Newsgroup: rec.ham-radio
Date: 1989-08-31 16:18:00 UTC
From: SS@S47.Prime.COM
Message-ID: <386400004@S47.Prime.COM>
Source record: 17212

[are there really any line-eaters left out there?]

Over the last few months, I've seen a lot of messages on rec.ham-radio where one person is using the net as an alternative to sending mail to a specific person. I came across this excerpt from Usenet policy on doing this and thought I'd post it for those who may not be aware of the policy.

Also note that some sites are hooked into the net using dialup connections operating at a relatively slow speed like 1200 bps. As you can see, every message takes time to transfer and with dialup lines time equals money. It's often the sites that can least afford the expense of the net hookup that use dialup lines, hence it is those very sites for which unnecessary net traffic has the most severe financial impact.

Anyway, here is the bit on Usenet policy. Note especially the last sentence about making a phone call, sending postal mail, or (I'd add) sending a fax if both parties have that capability.

Please understand I am in no way directing this posting to anyone in particular (i.e., this isn't a disguised flame :-)).

/* ---------- "Rules for posting to Usenet (Update" ---------- */
Original-from: mark@cbosgd.att.com (Mark Horton)
[Most recent change: 11 March 1988 by hoptoad!gnu (John Gilmore) and spaf@cs.purdue.edu (Gene Spafford)]

In general, when a mailing to somebody fails, DON'T post a message about it! Think for a moment: you are trying to send something to someone on ONE system. Your message might go through (at most) TEN systems on the way there. Posting a message in the news sends it to over 7800 systems throughout the world! There is no way to justify adding to the news load of nearly 8000 machines simply because you cannot determine how to get your mail through.

If your message is important, contact someone who knows more about the mail system and who might be able to help you get your message through. Your local system administrator, for instance, or the admin of the next site "upstream," might be able to help. You can also send mail to "postermaster" at one of the backbone sites. Almost all of these people would rather see an occasional plea for help in their mailbox than read another broadcast in the news system. If your message is *really* important, pick up the phone and try to call the other person. [or write to the person using his postal address!]

[end of policy quote]

>
>Brian Perkin
>N6RSW

Well I called Kenwood in Long Beach to get the facts, here is what I learned:
Cost is $99.50
If you can use a screwdriver you can replace... But Kenwood service will also
do it for a "nominal" charge (HI HI).
It replaces the entire front Bezel of the unit with LCD...
LCD is same type as on TM-731A, 631A
Adds the ability to use RC-20, and other acc.
Does not put the ability to use CTCSS decode on the main band
Does not increase the recieve as with the 731A.
It will be available in about 4 months...

This is all I know!!!!

73 and Good luck,
DE KJ6NN
Phil

From: jsb@hpfinote.HP.COM
Message-ID: <16170006@hpfinote.HP.COM>
Source record: 17218

I have been asked by several ATV groups about backround music on video tapes used for material. Questions came from the angle that if this was indeed 'backround' and not the primary content, that it might be ok. The same question could be asked if a local FM radio station was playing in the backround while you conducted a 2 meter conversation. In your case, the content would be 'coded' in digital formats.

You will note in Part 97.115 that it clearly prohibits the transmission of music. The 'intent' of the law is to nix transmission of music period. Part 97.115 does not prohibit specific transmission modes for music, it simply states 'NO MUSIC'.

So, it is the control operator's job to insure that music is not part of a person's transmission, whether it's backround or 'disguised' in digital form.

Hope this helps, or email me and we can continue.

>For the record, Radio Shaft CATV coax is more than adequate. It has 100%
>foil shielding and a few strands of steel wire for continuity. It is

The CATV people might differ with you on this (an engineer with TCI of Oregon definitely does). There are several flavors of 100% foil shielded CATV coax. I believe the RatShack stuff and much of what's commonly available has foil that is not bonded to the center core. The result is that making leak free terminations is more difficult and repeated flexing tends to cause the shielding to degrade. The few strands of braid are usually aluminum, not steel. Also, the braid coverage of the cheap stuff is often 40% or less.

The coax at least two of the local CATV firms around here use has one or more layers of foil (100% coverage) with one *bonded* to the insulating core. 61% or better coverage braid is also in the coax. If you believe what Belden and other manufacturers put in their catalogs, the bonded type can make as much as 20 dB difference in the shielding effectiveness, in addition to helping make sure that connector termination is good.

But... a recent surprise to me was... TCI Cable of Oregon has already adopted the philosophy that customers can do the inside wiring. Their chief engineer gave me the reasons as customer flexibility, there will probably be legislation that requires they allow customers to do this, and many customers were doing it *already* (often not correctly). New "security boxes" that are installed now have a "customer access door". Mine does. Currently, they install the first inside outlet as part of the normal connection fee.

In general, he didn't seem too worried about egress for the simple reason that ingress makes the TV unwatchable long before egress exceeds any limits. From my home wiring experience, this is quite true, but it probably only applies in areas where the in air signal levels are high.

In my opinion, allowing customers to do their own wiring is generally good since it gives the cable company the ability to give out information on how to do it correctly. If it's not "legal", the company can't give out information without encouraging breaking the rules. Those who are motivated to do their own wiring will probably do it whether or not it's allowed; at least now they can help them do it right. How about FCC 'approved' coax to help insure that acceptable cable is sold for consumer CATV use?

Maybe for taking the test, but I would not advise this in general.

> The problem with all this is that it is not illegal for non-hams to own

> sort of penalty...

I am not one of these people. I think prospective hams should get in contact with local hams (call the ARRL and find out) before investing in ANY equipment and see if they like what they see/hear. Then when they decide the do want to get involved with the hobby, they can get a transceiver and start listening on their own and learning.

I do NOT propose making any laws or rules restricting radio sales. I will, however, focus my business with dealers that make a GENUINE effort to make sure they are NOT selling radio transmitters to someone who is not either a ham or a prespective new ham. I suggested purchase via Elmer as a simple way to get the radio in the hands of the prospective ham; it need not be the only solution. A non-ham who goes to a dealer's store in person can get to know the sales people and convince them that he/she is genuine, and then I would see no reason to restrict any sales.

I think dealers need to do more than just make sure people know they need a license to actually transmit; they need to verify that the person is genuinely going to operate with a license, and that this sale is not profit for the dealer in exchange for trashing the ham bands (or any other radio service for that matter). It's all a matter of attitude on the part of the dealer; the one with "profit only" won't be getting my business.

It appears to be a valid implementation of FTP, with some quirks added.
It is probably the case that your valid implementation has its own quirks
added that makes them somehow incompatible.

I notice that their FTP server gives a multi-column response to the "ls"
command, which is used by commands such as "mget" to retrieve multiple
files. Maybe they intended to defeat this capability.

> 'shack', and not over the air.

> Is it legal to transmit music this way? Any suggestions or other ideas?

If the digitizing you use is not encrypted, then it is receivable by anyone,
and if the material is music, the FCC prohibition still applies. The rule
does NOT say things like "no music if you use AM, SSB, or FM", it just says
"no music".

If it is encrypted.... well it's still music AND its encrypted.

IMHO, the spirit of the rule is to prevent broadcasting and entertainment by
radio. If ATV'ers start sending entertaining video (w/o music) over the bands
then someone might propose a rule against it. We don't need more rules.

Go back and read 97.1 and see if what you want to do makes sense according
to that rule.

Wrong! You will have a 3 dB. signal/noise ratio *loss* if you only
demodulate one of the two sidebands. This is because the two sidebands
add *coherently* (i.e. voltages not powers add) so that two sidebands
combined are 6 dB. higher than either one by itself. Since the noise
goes down 3 dB. (as you correctly pointed out), you lose 3 not 6 dB.
of signal/noise ratio. See Carlsen: Communication Engineering.

> If you are really keen, you demodulate both sidebands, and then feed the
> two independent audio signals (in the right phase of course!) into an

Not only do the two sidebands have to be phased to add not subtract,
but the L.O. for the demodulator has to be within a few 10's of degrees
of the phase of the orignal carrier. Many PLL's operate in quadrature
so the output is 90 degrees out of phase with the reference. This
must be avoided or compensated for if you want true DSB reception.

Another opinion: The radio tech who's in charge of local FBI fleet is on our club repeater. Figuring that he'd know about hidden antennas, I asked him about whether I could use my FM windshield antenna for 2m. His reply was they don't radiate very well, are quite directional, and tend to explode when fed with high power, which rather negates the disguise. (He says FBI mobiles are all 170W.) Defroster wires aren't buried in the glass like FM antennas, but be careful anyway.

Somehow, feeding my xmtr into a resistor doesn't sound like the way to put out a killer signal.

2396. Yaesu service manuals

Selling ham gear to non-hams, well here in the UK it is actually an
offence to have equipment set up & 'usable' if you do not have a license.
There is no requirement for proof of use, it is considered that setting up
the equipment in a way that would allow use is adequate proof of intent to
use. But this is open to interpretation. You have to convince the Judge!
For example, if a non-licensed person
buys a HF-bands rig & a transverter, and installs it to listen on, with the
intention of passing the exams, then i dont think he would be jumped upon,
even though he has the ability to transmit on HF and VHF.
The law was primarily introduced to provide a means of prosecuting illegal
CBers (posession of a CB that is non-licensable in the European Economic
Community countries is an offence...) the problem being that until this law was
passed, the enforcement officials actually had to catch the illegal operator
in the act of transmitting! You cant see RF, so this was rather difficult...!
The problem gets even harder with modern 'wideband' transmitters that can
work outside ham-bands. You havent got a license to operate outside ham
bands, so as far as the law sees it, you shouldnt have such a transmitter.
Thats why most of the rigs sold here are restricted coverage (but snip a few
links, add a diode or two.....!)
So basically you can buy/sell/have a transceiver in your shack and even connect
them to antennas for use on receive, but the judge wont like it if you have
a microphone or key attached and ready for use, unless you have the appropriate
license to allow you to use it.

Uhh.. The cable drop to my house looks just like the Radio shaft stuff.
Foam insulated, wrapped foil shield and 6 or 6 single strands of steel
wire around that. The steel wire must be strictly for strength and
continuity across pieces of shield foil. Yes it does make terminations
more difficult than the double-shielded wire but it is in common use.

>The coax at least two of the local CATV firms around here use has one

IN the last town I lived in, I was involved with the cable company
in a consultant role. I became quite familiar with their physical
plant. There, they used a belden wire (I think) that used a foam
insulation, had a graphite coating over that, a foil shield, a 100%
coverage tin-plated copper braid, and the braid was impregnated with
a thick silicone grease. Very nice wire but very expensive.

>But... a recent surprise to me was... TCI Cable of Oregon has already
>adopted the philosophy that customers can do the inside wiring.

I don't really believe leakage from customer drops will be a problem
IF the drop signal level is set correctly. The drop boxes used in the

system I mentioned above had connectors that could be screwed in or out to change the coupling and thus the signal level. The installer would use a field-strenth meter to adjust the tap to a standard signal level.

Apparently here in Marietta, they don't have those facilities. The signal level comming into my house is way too hot. Even with 6 outlets in my house, I had to attenuate the incomming signal to kill interference bars and ghosting. I currently have a 20 db pad in the incomming line!

The major intereference problem comes from leaky feeders. Here the levels are much higher. I'm reaching back deep into old memory but as I recall, the specification for a neighborhood feeder was for the signal to be at +10 dbm which is a LOT of power. Improperly terminated connectors or damaged line (you'd be surprised at how many people like to shoot these cables) will radiate a bunch of signal.

"The TH7 from HELL"

An Epilogue and Happy Ending.

Golly, I really didn't expect any significant response when I forwarded my note on the TH7 to Gene WA1UXA ... and was I I ever wrong. There was a significant response, from hams I've never had the chance to meet, and from hams I have known for years.

Gene asked that I compile the results of the these responses and he would redistribute them, so here goes. There are a couple of surprises so read along.

In General

There were many responses discussing both the TH7 and KT34-XA. A universal comment was that both of these beams were showed changes in SWR in RAIN.

If you are QRO, donate that BN-86 balun to a new ham.

Hi-grade low loss coax is much less likely to obscure misbehavior by an antenna and especially a tri-bander, than will a more lossy coax. This is because more lossy coax will lose the energy reflected on the way back and you won't see it. More than one ham wrote and reported that they too experienced what I did when very low loss feedline was used.

After taming, both TH7 owners and KT34-XA owners love their beam.

The Specifics.

Almost all of the observations I made in my first note were born out in other peoples experiences.

The post-rain problem was acknowledged by HY-Gain and is to be fixed at some unspecified time in the future. They did give us an ECO (fix).

The plastic cups on the outer sides of the traps collect water. Drilling them out in the same plane as the trap holes seems to clear up the problem. HY-Gain says that this is only necessary for the driven elements. But if one looks at the trapped director and reflector, mechanically they look just as susceptible. I would do this if I was putting up the beam again. As it is

now, I've been up there so much, I'm beginning to grow feathers.

The extremely high SWR fell off over the course of a week as
the traps dried out. Several of us as a team applied the ECO
without taking the beam down. Thank you Sterling AK1a and
Kevin KA2EYP.

I wanted to thank all of you for the encouragement, support
and information. It was really wonderful hearing from you'all.
That about wraps up this adventure but stayed tuned for
more exciting adventures of KC3NG in "The Power Lines
from New Hampshire" playing on a computer terminal near
you.

SCOUTING AND AMATEUR RADIO: A GREAT COMBINATION

Supported by a staff of 35, K2BSA was in constant operation at this year's National Boy Scout Jamboree at Fort A. P. Hill in Virginia from August 2 through August 8. K2BSA had two separate locations at the Jamboree site: One for teaching Radio Merit Badge and licensing classes; the other for the demonstration station. ARRL HQ staffer Rus Healy, NJ2L was on hand to provide assistance with the demonstration station.

With monobanders on 10-40 meters, K2BSA operated several stations simultaneously on the HF bands. There was also a fast scan TV link to the Merit Badge Midway about 2000 feet away from the demonstration station. A popular activity was the ATV/packet radio link between the Midway tent and the demonstration station. The Scouts sent messages to one another via packet radio while viewing each other on TV. Another popular attraction was the K2BSA satellite station. An IBM \r/ compatible computer ran N4HY's QUICKTRAK software, which was an effective tool for explaining satellites to the Scouts. AO-13's elliptical orbit also helped out, keeping the satellite accessible for hours on end.

The station operators and participants made several thousand QSOs, worked all states in about one and one half days, and contacted 150 countries during the Jamboree period. More than 2040 messages were originated and sent from the Jamboree.

About 400 licensed Scouts and Scouters signed the K2BSA guest registry. Use of the linked 2 meter and 220 MHz FM repeaters on the site was heavy. There were several occasions when K2BSA staff operators and others used the repeaters to relay information that helped in emergencies and with the

ingress and egress of Scouts during the opening and closing days.

Eleven Scouts earned their Novice licenses at the Jamboree, 74 earned the Radio Merit Badge, and over 350 completed parts of Radio Merit Badge. Among those scouts upgrading at the Jamboree was Greg Beaver, KB8GPC, a 12 year old from Lansing, Michigan, who upgraded to Extra at the Jamboree. Greg received his Novice in March.

US AMATEURS INVITED TO RUSSIA

The Khabarovsk Amateur Radio Club in the USSR has extended invitation to 50 US amateurs to visit them in the USSR from September 22-29. The first 15 amateurs to accept the offer will have most of their expenses paid for while in the country. The cost of air fare is $2100 from Portland Oregon. Visiting amateurs will be able to participate in the USSR Radiosport Contest being held from September 22-26. Khabarovsk is approximately 400 miles northeast of Vladivostok, in the southwestern portion of the USSR.

To make your reservation and for more information, contact John White, RUN in Portland at 503-287-6127 evenings or weekends or at 503-294-4200 during week days.

RETALIATORY TARIFFS CALLED OFF

On April 28, 1989, the US Trade Representative determined that certain practices of Japan with respect to radio and cellular telephone products and services were not in compliance with Japan's commitments under the Market Oriented Sector Specific (MOSS) Agreements. A public hearing was held on May 24 as to what measures to take against Japan (which could have icluded imposition of 100% tariffs on some radio equipment to be imported from that country).

ARRL Counsel Chris Imlay, N3AKD, filed comments for that hearing, pointing out that the measures proposed were so broad as to present a hardship on radio amateurs. The action was delayed by order May 28 and negotiations with Japan were held from June 19 to June 28. Agreements were reached, and as a result, the Trade Representative terminated the proceeding by notice published in the Federal Register.

IARU ELECTS 127TH MEMBER

Ballots counted, 77 member societies of The International Amateur Radio Union (IARU) voted unanimously to admit the Aruba Amateur Radio Club into the Union. Founded in 1925, the IARU is the federation of national Amateur Radio societies representing the interests of two way Amateur Radio communication world wide. The ARRL is International Secretariat for the Union.

The ARRL Letter, Volume 8, Number 17; August 25, 1989 - Part 2 of 3

FCC DENIES PETITIONS FOR RECONSIDERATION IN 87-14; REAFFIRMS REALLOCATION

The FCC has reaffirmed the action taken in the August 4, 1988 Report and Order in General Docket 87-14 reallocating 220-222 MHz to the land mobile

service. In a Memorandum Report and Order adopted June 15, 1989 and released August 17, 1989, FCC denied petitions for reconsideration filed by ARRL, the National Communications System (NCS), TV Answer Inc (TVA), and more than 700 amateurs.

In the Memorandum Report and Order, FCC stated "the Commission considered a variety of factors in reachin the decisions in the first Report and Order. Among these factors were the need to provide for narrowband land mobile operations, the impact of existing amateur use, the potential for interference to TV broadcasting and the actions of the 1979 WARC. The Commission concluded that the public interest would be best served by providing dedicated spectrum for the development of narrowband, spectrum efficient land mobile technologies." FCC noted that it was sensitive to the needs of amateurs, but stated that the remaining specrum (222-225 MHz) "should continue to provide adequately for this service."

ARRL and many other amateurs noted that there was no need for additional spectrum for the land mobile service according the the FCC Field Operations Bureau (FOB) 1985-86 studies. FCC stated "it is not necessary...to resolve issues pertaining to this study. ARRL proposed alternatives to 220-222 MHz such as 30-50 MHz and 216-220 MHz. FCC stated "...such reallotment would entail severe costs to...users...such as the police and fire service." Amaturs fault the FCC in failing to collect meaningful data on usage of 220 and for using The ARRL Repeater Directory as a barometer of usage since it is not a complete listing of users of this band. ARRL noted that there are at least 773 fixed stations and 1106 weak signal users of 220-222 MHz. ARRL comments noted that FCC averaged the numbers throughout the US when, in fact, use is concentrated in metropolitan areas. FCC stated that "the principal use of 220-225 MHz is for repeater operations" and that the Repeater Directory is a "reasonably accurate" reflection of usage.

According to the FCC, operations in 220-222 MHz could be relocated to 222-225 MHz even though amateurs have stated, particularly in California, they would find this difficult and costly. FCC stated that, while it may be difficult to relocate some control links, it could be done through frequency sharing "at little or no cost." Amateurs have stated that packet radio is a new technology and it requires the same consideration as do new technologies in the land mobile service. FCC stated that there were provisions for packet radio in the band plans of other amateur bands such as 420-450 and 902-928 MHz and that packet radio could be accommodated there. ARRL and other individual amateurs have stated that the loss of 220-222 MHz will impair amateurs' ability to provide emergency communications and NCS said that the reallocation runs against national security interests. "...NCS has made no showing that amateur spectrum is inadequate" according to the FCC. With regard to procedural issues, FCC stated "A number of amateurs, including the ARRL, claim that there were procedural irregularities in this docket. They argue that the irregularities caused serious damage to the quality, fairness and accuracy of this proceeding. Specifically, they claim that the comment period was short...[and] that, in light of overwhelming opposition by amateurs, the Commission's decision is not supported by the public record." FCC went on

to say "the Commission followed the normal procedure for rule making proceedings..." Concerning the argument that the decision is not supported by the public record, FCC stated that it "must base its decision on the merits of the issues and not the number of comments filed in favor of a particular point of view." Additionally, amateur interests have asserted that the FCC violated its own rules in accepting the late filed comments of UPS, that there was little or no support for the proposal within the land mobile community and that the outcoee wa predetermined. FCC stated that they accepted the late filed comments of UPS in order to create as complete a record as possible and that this was in accordance with Section 1.415(d) of the Commission's rules.

The release of the order sets the clock running for ARRL's opportunity to petition the US Court of Appeals for the DC Circuit requesting their review of the FCC decision.

The ARRL Letter, Volume 8, Number 17; August 25, 1989 - Part 3 of 3

MICROSAT LAUNCH DATE DRAWS CLOSER

On November 10, 1989 AMSAT will once again demonstrate what can be done with the help of volunteers, donations, and the creative energies spawned by devotion of Amateur Radio enthusiasts. Being touted as inaugurating "a new era in Amateur Radio communications," an Ariane IV rocket is scheduled to carry six Amateur Radio satellites into orbit from the spaceport of the European Space Agency located near the equator in Kourou, French Guiana.

Four of these six satellites have been dubbed Microsats because of their unusually small cubed shaped size measuring 9 inches on a side. The design and construction of these MicroSats has been coordinated and organized through the efforts of the Radio Amateur Satellite Corporation (AMSAT) in collaboration with the ARRL and the Tucson Amateur Packet Radio Association (TAPR). AMSAT has been responsible for the design and construction of numerous Orbiting Satellites Carrying Amateur Radio (OSCAR's), over the past twenty years.

The Microsats represent a departure from the trend of OSCARs being heavier and larger than their predecessors for a good reason. The Shuttle Challenger accident more than three years ago caused a scarcity of launch opportunities and AMSAT found it necessary to turn to a small satellite design which requires only modest launch support services that can fit in places on the launch vehicle normally reserved for lead ballast. The MicroSats fulfill that requirement in every aspect of their design. AMSAT, working with the ARRL, TAPR and other members of the Amateur Radio community reminds us that state- of-the-art design in Amateur Radio is not only alive and well, but still very exciting and possible to do.

FCC AFFIRMS DECISION ON 17 METER PRIVILEGES

The FCC has denied a request by Dennis Murphy, KB6LZW to allow access to the 18 MHz band by Novice and Technician Class operators.

Murphy had requested that the 18.068-18.110 segment of the 17 meter band be opened to all classes with a power restriction of 200 watts for amateur stationwhose control operators hold either a Novice or Technician operator license. FCC had styled Murphy's letter as a petition for reconsideration, though it was not apparent from the letter that this had been his intent. ARRL supported the Commission's earlier decision concerning 17 meter privileges

FCC decided that Murphy failed to present any facts or arguments not previously considered in its Report and Order. The Commission went on to say that "Novice and Technician Class operators should be excluded from the 17 meter band in view of the enhanced privileges that they had recently received and because of the band's small size. In addition, we reiterate our belief that the potential for interference in the 17 meter band will be minimized if the skills associated with the General Class or higher operator license are required."

WESTLINK'S 1989 YOUNG HAM OF THE YEAR

The Westlink Report and Yaesu USA announced on August 9 that 18 year old Erin McGinnis, KA0WTE, of Topeka Kansas had been named the Westlink Report Young Ham of the Year.

Erin was chosen to receive the award for her ongoing dedication to Amateur Radio public service activities, disaster preparedness work and publicizing Amateur Radio.

To help publicize and expand Amateur Radio in her community, Erin has organized press releases and on site television interviews for the local and national electronic press, assisted in the development and preparation of a city resolution declaring Field Day week to be "Kaw Valley Amateur Radio Club Week" in Topeka and organizes and teaches in the club's fall Novice training program. KA0WTE will receive her award at the ARRL Southwestern Division Convention Grand Banquet the evening of August 26 in Los Angeles, California.

THE NEW FCC RULE BOOK AVAILABLE SOON

With 288 pages of mostly new material, the new edition of the FCC Rule Book is at the printer. Rick Palm, K1CE, headed the team of editors as well as writing several of the chapters himself. Other contributors to the editorial effort were Paul Rinaldo, W4RI, Bob Halprin, K1XA, Bruce Hale, KB1MW, Joel Kleinman, N1BKE, Mark Wilson, AA2Z, John Hennessee, KJ4KB, and Jay Mabey NU0X with inputs provided by ARRL Counsel Chris Imlay, N3AKD and Dale Clift, NA1L.

The new 8th edition is based on the FCC's rewrite of Part 97, to take effect on September 1. It features 15 completely revised introductory chapters with explanations and interpretations that make the often complicated rules easier to understand. Also included is a complete reprint of the new Part 97, as well as pertinent sections of other parts of the FCC rules.

2403. Kenwood 721A upgrade

Well, I just called kenwood again about the display upgrade for the
TM-721A. I found out that they have not decided to build the new display
yet and if they do they should be available in LATE DECEMBER...

Damn, I really need that display... I would like to continue to use the
radio in the car...

Every-one call and write Kenwood, if you want the upgrade.... Maybe interest
will spark the $$$ in their eyes....

Let's not be in too big a hurry to fill the UHF bands with ATV. I agree we need usage but especially as our resources become scarcer for information communication we need to watch that we have equitable sharing. ATV, with only a user or two using 6 MHz of bandwidth per QSO, is pretty expensive, particularly if it is at UHF and omnidirectionally broadcast. I would rather see this portion of our spectrum supporting wideband digital data, which could be running audio, video or computer applications than see a proliferation of ATV channels serving only a special interest group.

The particular advantage of UHF is that it is the only place where we have both available bandwidth and the ability to broadcast omnidirectionally while maintaining reasonably efficient use of resources. At microwave we have to use electrically large (directional) antennas to make good use of hardware and at VHF and below we don't have the spectrum to support high information rates. Using the UHF spectrum for individual user access to a digital network would allow a variety of applications, including ATV, while still allowing local area omni broadcasting. By connecting a number of local omni-broadcasting clusters with microwave point to point digital links we also allow for much greater DX and participation in a particular application by users throughout the network. I think we have to avoid operation which saturates large areas with wideband RF and is available only to a small number of users.

SUBJ: Reply to Mike Harris, KM4UL

Mike,
Your friends are right !! The butterfly beam is a below-average performer.
The only advantage is that it is small and can fit into a limited
space application. If you are looking for a small beam that is a good
performer, check out the (seldom used) two-elememt tri-banders...
Hy-gain's is called the TH-2 and Mosley's is called the TA-32....

Also, on your R4/R5 question.....they are super verticals.....give
a 3db advantage over the other ones because it's a 1/2 wave
rather than the standard 1/4 wave set up......but if you MUST
have a vertical that will cover 80 & 40 meter coverage...
I would suggest the (seldom used) hustler 5btv...or 6btv....that
is a super antenna with high Q coils, stainless steel rugged
construction, and average cost.
good luck!

>novice class then also.

This reminds me of when I was a scout master a couple of years ago and two of my boys came to me asking what would be a good project to work on for a science fair. I thought for a while and came up with a project building a crystal radio. They seemed to think that this was a good idea, so I told them how to do it and made up some diagrams so they could wind the coil and wire the thing to an earphone and antenna.

To make a long story short, they received an honorable mention or maybe even third place at the fair (I can't remember exactly). This was not exactly a HAM project, but they knew that I was a HAM and that most of what I knew about the crystal radio was from my experience in HAM radio.

My point is, this was a fun project for both the boys and me. It also gave some exposure (however minute) to HAM radio that is not always exploited. I would encourage anyone who has the opportunity, to participate in these events whenever possible. They are at least as worth while as teaching boys how to mangle each other safely on the football field.

BTW: Does anyone know where you can get raw crystals? I suppose you could take one out of the packaging can. Not very big though. We had to use germanium diodes.

I was going to just reply via e-mail, but there are probably many of use
who need VC-II parts from time to time given Ma-Com's repair policy which
seems to be based on extortion.

Many of the "underground" newsletters carry ads from those selling VC-II
parts. I have heard good things about:

Lee Hadlock, Inc.
528 1st Avenue
Belmawr, NJ 08031

They have two lines, orders only to (800) 545-1151. They will also provide
limited over the phone technical assistance at (609) 931-0655.

Others I see ads for are:

V.V. Bytes Ocala, Fl (904) 368-2275
Testron Floral Pk, NY (516) 358-9414
CNH Towsend, GA (912) 832-4663
Walker Tech Catlett, VA (703) 788-9123

73, and good luck.

Now let's give them a break. They radios were probably really IC-32ATs with out of band mod to work on GMRS. The were running them cross-band full-duplex with everyone assigned a different transmit freq into a cross-band repeater in their truck with multiple receivers.

I thought that's why the 32AT was designed that way.

2411. Cross-Band Repeater Question

Newsgroup: rec.ham-radio
Date: 1989-09-01 21:15:19 UTC
From: pwl@tc.fluke.COM
Message-ID: <10826@fluke.COM>
Source record: 17128

It seems like it's about time to stir things up in this group. I have a question that has been bouncing around the local hams that doesn't seem to have a clear answer. Perhaps someone in net land can help us out.

There are several dual-band VHF rigs available these days that provide a feature which is usually called "cross-band repeater". The idea is that you use the receiver for one band to feed the transmitter for another band. For instance, you could take a received signal on 2-meters and retransmit it on 220 MHz or 440 Mhz. Of course the inverse is also true, i.e., in on 220 or 440 and out on 2-meters.

Now the question. Would this operation be considered a "repeater" or would it fall under the rules for "auxiliary control"? If it is a repeater, then the rules require that you identify the repeater as a separate entity from yourself. If it is just a form of auxiliary control, then it seems like the rules don't require a separate identification.

Now at first glance, this sure looks like a repeater to me. However, I looked in my ARRL FCC Rule book (circa 1987) and their description of auxiliary control seems like it might apply.

So what do you think? Is it a repeater or is it auxiliary control. Of course, with the new Part 97 coming out soon, it could be possible that the answer may be different under the new rules.

> range, often without knowing it.
> While we're getting ham TV up there, let's get manufacturers to include
> a VSB filter standard. There's no place for 15 MHz signals where 6 MHz
> signals will do.

My gosh, Jay, I actually agree with you!

But still, one of the ATV "channels" (which is just 6 Mhz wide) is 438
to 444 Mhz (video carrier at 439.25 Mhz, and audio carrier at 443.75 Mhz).
This overlaps 2 Mhz of the 3 Mhz of one of the repeater subband pairs.
What can be done about that? Here in Illinois, a group of repeater owners
who are self-appoint spectrum coordinators, and DISALLOW MEMBERSHIP BY ANYONE
OWN DOES NOT OWN A REPEATER, are trying to wipe out ATV in that frequency
range rather than try to work out a reasonable solution (which know one has
any idea of what can work yet because the repeater types won't cooperate).
One of those infamous lawsuits is in progress just because of this idiocy.

Jay... got any ideas on what to do about the ATV vs FM on 442-444 Mhz problem?

Bruce, its time to go BACK to that school and bring up the issue of science fairs again.

Sports is an important part of the educational process, whether it is competition between schools, or just a gym class. But science and other fields are JUST AS important; the problem is that the schools do not see that.

One would not expect everyone to do everything, but the opportunities for each to do what they are best in, and still do a little of everything, is needed.

When I was in high school, I knew a guy who played football and basketball. He was on the 2nd string of the football team, and started on the basketball team. The same guy took first place in the local science fair two years in a row. He played a leading role in 2 of 4 class plays put on in our school. He played sax in the Jazz Ensemble. He was an assistant editor of the school's little literary paper. During one summer I remember seeing him winning a blue ribbon at the county fair for raising a prize bull. Now that seems to me to be a well rounded individual (even though he wasn't a ham :-).

The best we can hope for for our youth today is to teach them about all things in class, and give them the opportunity to excel in one or more areas they would choose. If they choose sports, that's fine. If they choose the science fair and the school doesn't have one, that's a tragedy. If they choose literature and the school does not have a literary publication, is just as much a tragedy. If they choose acting and there are no plays to be in, again it is a tragedy.

The school system that does not provide OPPORTUNITIES has something wrong with it and they need FIXING.

--Phil howard-- <phil@ux1.cso.uiuc.edu>

2417. Curing Regency MX7000/MX5000 microprocessor RFI

Newsgroup: rec.ham-radio
Date: 1989-09-02 09:14:30 UTC
From: gkd@wpi.wpi.edu
Message-ID: <3801@wpi.wpi.edu>
Source record: 17142

There has apparently been much talk about curing the internal microprocessor-generated RFI which is characteristic of the Regency MX5000 and MX7000 scanners. This RFI produces an effect similar to "birdies" except that the RFI wanders around in frequency. (The actual frequencies of the RFI seems to vary with the temperature of the CPU chip.) I completely cured this RFI on my MX7000 scanner about a year ago. Until today I did not know of anyone else who had tried my cure; but I just got mail from someone who tried it on an MX5000 and reported good results.

The cure is actually a combination of two measures; one of which I read about in an article by Philip Smith in the May 1987 issue of Monitoring Times. It consisted of installing an electrolytic capacitor on the main PC board, and was fairly easy to do. The second measure I discovered through experimentation. It involves changing a resistor and capacitor on the CPU board, and requires some delicate soldering. Philip's article states that adding the electrolytic capacitor to the MX7000 scanner reduces the RFI by 95%. Similarly, my measure eliminated virtually all of the RFI. The combination of the two measures was 100% effective for me, but I can't say which one alone is more effective since I'd already changed the components on the CPU board before adding the electrolytic capacitor. Note that changing the components on the CPU board is a much more delicate operation than adding the electrolytic capacitor, and also shortens the power-disconnect memory life from 7 days to about 8 hours. Therefore, it might be desirable to add the capacitor first and see whether the remaining RFI is acceptable to you before changing the components. I have not found any other side effects caused by these modifications in the year since I performed them, but I can't offer any guarantees either.

MODIFYING THE MX7000 (and maybe the MX5000) TO ELIMINATE INTERNAL RFI

Part 1 - Installing an electrolytic capacitor on the main circuit board.

This modification originally appeared in the May 1987 issue of Monitoring Times in an article by Philip Smith. Philip used a .47 uF electrolytic capacitor in his radio; I found that a 10 uF electrolytic seemed to work better for me.

Locate J4 along the back edge of the main circuit board, near the right rear corner of the board. Viewing the board from the front of the radio, the right-most pin of J4 has a blue wire going into it. The positive lead of the capacitor should connect to that pin. The easiest way to do this is to carefully insert the capacitor lead into the jack alongside the wire so it makes good contact with the pin. The negative lead of the capacitor goes

to ground. It can be inserted under the PC board mounting screw in the right rear corner of the board. I chose to scrape clean a small section of the ground foil which runs alongside J4 (between J4 and the board edge) and solder the lead to it. After the capacitor is installed, the radio may be tried out to check on the cure's effectiveness.

Part 2 - Replacing R6 and C3 on the CPU board.

This measure should only be attempted by those who feel comfortable doing some delicate soldering in fairly tight quarters.

Locate C3 on the CPU board. This is a small 33 pf capacitor located near the edge of the PC board (behind the LCD display). R6 (a 150K resistor) stands upright next to C3, and is the resistor which controls scan speed. Changing C3 to a .01 uF capacitor eliminates the RFI, but also slows the scan speed to something ridiculously slow (as if it wasn't slow enough already). Thus, it is also necessary the change R6 to restore the scan speed. I changed it to a 3300 ohm resistor, which restored my scan speed to about 50% above the factory setting. (Prior to performing this modification, I had set the scan speed to this rate by paralleling R6 with an 82K resistor.) The scan speed can be further increased by using a smaller resistor, but I found that my scanner started missing calls when the speed got any faster.
Even now, I use the slow speed when I'm scanning channels programmed in 12.5 KHz increments since the scanner mysteriously scans these channels faster. (My current slow speed is equal to the factory fast speed.) Since there will likely be some tolerance variations in .01 uF capacitors, it may be desirable to experiment with different resistance values for R6 to achieve the desired scan speed. Note that increasing the scan speed with also change the pitch of the keyboard beep.

Rather than removing C3 and R6 from the PC board, I chose to leave them in place and simply "piggyback" (parallel) the new components on them. Notice that there is a piece of PC board foil between R6 and C3 connecting the two components. One lead of the .01 uF capacitor can be soldered to this foil, and the second lead can be soldered to the ground PC foil which runs along the closest edge of the board. Similarly, one lead of the 3300 ohm resistor can be soldered to the PC foil between R6 and C3 where the capacitor was soldered. The other lead can be soldered to the top lead of R6 provided that the insulation on this lead is scraped off first.

The capacitor and resistor used should be as small physically as can be found. A 1/8 watt resistor would be ideal, but a 1/4 watt should also fit. Be sure that the components clear the chasis and other PC boards when the scanner is reassembled. Remember, this modification will decrease the power-disconnect memory life to about 8 hours.

I hope all of this is of use to someone.

-Greg

2419. ic-2gat help?

Newsgroup: rec.ham-radio
Date: 1989-09-02 19:45:00 UTC
From: fligor@ux1.cso.uiuc.edu
Message-ID: <30500167@ux1.cso.uiuc.edu>
Source record: 17143

I know this will make me sound like a cluts, but here goes...

I dropped my Icom IC-2GAT from a 12 ft. ladder onto carpeted concrete.
it still works, but the LCD display isn't in top form any longer.
the very first digit (the small one) only displays 1 of it's 7 segments.
i've opened it up and taken a look, and there's nothing I can see that's
wrong (not unusual in micro electronics, I'm sure). However, the enitire
top of the radio (knobs, display, etc.) is a removable segment that is just
cabled to the rest of the radio. Since all the display is working except
one digit, and the specs say that the freq. is multiplexed in, I assume that
the problem is in the display area.

Now for the question...does any one know if I can just buy the top part
of the radio, and if so where I can get it? The place I bought it
suggested that I ship it to ICOM, but then I won't have a radio for
however long it takes, not to mention the cost...labor I know I can do
as well as they can.

thanks in advance for any help,

-debbie KA9JYI

>over here on REC.HAM-RADIO?

If the individual "trying out" the radio is not a licensed ham, and is
not accompanied by a licensed ham who can look over his shoulder
(literally) and serve as control operator, then he/she breaks the law
if/when he/she transmits. It's the same as operating a transmitter
under any other circumstances.

Notice that the radio store is not an FCC cop, and is not in charge of
enforcing the FCC rules. They are providing a valuble service to their
customers. The customers have obligations to follow the law no matter
who's radio they're operating.

I never said anythign about a law. You obviously don't like my efforts
and are now trying to brandish that as an effort to create a new law.
You are absolutely off track.

> Fortunately, there is no basis in law to take this idea beyond the
> pointless network discussion phase.

Since you are the one making this into a legal proposal, why don't we just
cut off your pointless rebuttal, and get back to the issue I originally
posted, which has plenty of basis in law, and is by no means pointless.

Just to refresh your memory, or to give you another chance to think it
through and try to understand, I will say it all over again, just for you.

I will seek to encourage dealers to sell equipment capable of transmitting
on amateur frequencies ONLY to persons who hold a valid amateur license
authorizing them to transmit on at least some of the frequencies the
transmitter is capable of transimitting. To reiterate for all the simple
minded people who haven't figured it out yet, I did NOT say anything about
proposing a rule or law forcing dealers to do this. The means by which I
will work on this is to encourage other hams to make their preferences for
a dealer based on known information about how these dealers sell their
equipment. If one dealer does better than another in this respect, that
dealer will get more of my business, and perhaps all of it. I will encoruage
other hams to choose the same way so that dealers, who are in the business
to make money, will see that restricting sales of ham transmitters to hams

is the way to go.

How are we going to squeeze 4.2 Mhz wide TV signals into 56 Kbaud and 100 khz signals without saturating a network, for under $500?

ATV'ers are also DX'ers. The range is nowhere as good as CW, but is does offer its own challenges (just like SSB DX'ing does).

We could argue that putting all of 80 and 75 meters into a voice/packet network would be good, but can it be achieved PRACTICALLY? What about 20 meters where the major activity is DX-ing?

--Phil howard-- <phil@ux1.cso.uiuc.edu>

2424. Re: Transmitting Music for ATV

Newsgroup: rec.ham-radio

From: phil@ux1.cso.uiuc.edu
Message-ID: <30500171@ux1.cso.uiuc.edu>
Source record: 17147

Just a further opinion on transmission of music:

Occaisionally someone will be heard on the air with music in the background. The FCC is likely NOT to pursue the matter, at least not any further than a warning, as long as it is obvious the control operator didn't have a practical way to suppress the music, didn't intentionally allow the music to be sent, and didn't persist the transmission for very long if the music could not be stopped.

Since the wording of the rules refers to "music" with no qualifications, I personally suspect that it can be interpreted to mean that music in any form cannot be sent. Digital input files for music playing programs is a form of music just as much as an analog waveform of the sonic vibrations is. Even a TV or FAX image of sheet music is still music. I doubt that these cases I mention will be as vigourously prosecuted as a blatant transmission of Beethoven's 5th over the local repeater using FM mode and the sound of the music; I just bring up this point for you to think about before you try to "loophole" your way around the rules (I see no loopholes).

My opinion is that it is legal for licensed hams to operate the equipment.
If a salesman operates the equipment as a part of his job, either to set up
the station, or as part of an effort to sell you equipment, then he is
violating rules on business or compensation. FCC rules do allow for an
experimental license for purposes of demonstrating equipment for purposes
of selling. I've never heard of an amateur dealer obtaining one, though.

>One of those infamous lawsuits is in progress just because of this idiocy.
>Jay... got any ideas on what to do about the ATV vs FM on 442-444 Mhz problem?

Weeeeellll..... (putting on director's hat, since president's hat got
passed along to someone else last month) We don't have much of a problem
in Texas (as far as I know) with ATV vs. repeaters on that channel. We
did decide to avoid allocating repeaters on 443.725, 443.75, and 443.775
to avoid any potential problems with the audio carrier.

I'm not sure there is much of a short-term solution; the US ATV Society
(I think that's the name, anyway) has taken the position that the lower
24 MHz should be used primarily for ATV, so the Illinois repeater types
aren't the only ones being unreasonable. The long-term solution is
probably for the ATV people to move to a higher band, like 902 (where I
understand there is now a commercially available rig) or 1296.
Realistically, the ATV types only have 2 channels available (420-426,
and 426-432), and that gets cramped in a larger city; for them to use
both also requires that each station pay close attention to actual
occupied bandwidth. I turn bright purple evry time I think of those
idiots at PC Electronics selling ATV transmitters with absolutely no
bandwidth-limiting devices built in.

2430. FREE Ham Radio class at UI

Newsgroup: rec.ham-radio
Date: 1989-09-02 22:51:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500175@ux1.cso.uiuc.edu>
Source record: 17151

Here is your chance to get a ham radio license.

The UI ham radio club, called SYNTON, is teaching a free class this semester for the Novice Class ham radio license.

Everything you need to get a Novice ham radio license is taught in this two meeting class. Everything, electronics, morse code, and radio rules.

And its FREE.

The class meets on 2 Saturday's, September 9th and 16th at 10 AM and runs through to 2:30 PM with a one hour lunch break. The meeting place is room 165 in the electrical engineering building (that's Everitt lab to the newcomers).

Interested in ham radio, but can't put up a station in the dorms or your apartment? The Synton club has a station you can use by becoming a member, and its right on the engineering campus. So go for it, get a ham radio license and you can get one of those ham call signs, too.

--Phil howard-- <phil@ux1.cso.uiuc.edu>

2431. Freqs for ATV (was not ANOTHER ...)

Jay Maynard, EMT-P, K5ZC, PP-ASEL, says (not entirely taken out of context):
>Realistically, the ATV types only have 2 channels available (420-426,
>and 426-432), and that gets cramped in a larger city; for them to use
>both also requires that each station pay close attention to actual
>occupied bandwidth. I turn bright purple evry time I think of those
>idiots at PC Electronics selling ATV transmitters with absolutely no
>bandwidth-limiting devices built in.

Well, Jay, I suspect that a number of poeple grow bright purple at the thought of ATV right on top of the weak-signal & EME range 432-433 MHz!!!

I look at this thoughtless recommendation by the ATV types as an indication of why we may need some ****legally-binding**** band-planning when (if) the hoards of big-signal, wide-band no-coders arrives. Remember that extreme sideband filtering will be required of ATV and digital rigs if they are to be operated anywhere near the frequencies used by the weak-signal crowd. We have never seen this degree of filtering in ham radio in the past. The ARRL Membership Services Committee seems to have been unaware of this problem when they rejected the VUAC 902 MHz band plan and adopted one with wideband digital adjacent to weak signal operation, requiring sideband attenuation of something over 100 dB per MHz. BTW, 902 is just too narrow to be much long-term use for ATV - one channel at most.

Or should we just forget UHF DX?

Excitedly, Bob W3OTC

> bandwidth-limiting devices built in.

Me, too!!! It's a shame that PC is the only place that actually verifies
that you are a licensed ham capable of legally using the transmitter.

I would buy from them if they had a product worth buying.

It's also a shame that another maker of ATV equipment is pushing FM mode
on the 23cm band (which definitely occupies at least 17 Mhz for full
resolution 4.2 Mhz color video w/o an audio subcarrier present).

I want a good VSB-ATV transceiver for 33cm and 23cm.

Above line A, and of course in Canada (which is also above line A :-) the
70cm band is 1/3 smaller. ATV'ers should of course have 1/3 less use of
the band as well. That leaves them 8 Mhz, of which only 6 Mhz is reasonably
usable. SO... where would you put JUST ONE ATV channel between 430 Mhz and
450 Mhz? That's a tough one (even if we assume ATV'ers aren't so greedy as
to ask for 2 TV channels in 430-450).

>form cannot be sent.

TORCH ON:

That's nice, but who cares what your suspicions are? Can you provide
ONE EXAMPLE of ANYONE being CHARGED with a violation under this law for
transmitting anything besides ACTUAL ON THE AIR MUSIC?

What do you call all those neat little 3 octave courtesy tones that you
hear on the repeaters. Look at the parameters for a courtesy tone on an
RC-850 controller. Talk about composing a "tune".

>Digital input files for music playing programs is a form of music just as
>much as an analog waveform of the sonic vibrations is.

Oh really? Maybe I can tape and sell packet radio transmissions to my
local radio station for rebroadcasting. BRAAAAP! BRAAAAP! BRAAAAP!
Hey it would sound better than scratching a needle across a record backwards
and now a days people actually call THAT music! In any case Phil, your
statement has no basis other than your own personal viewpoint.

>Even a TV or FAX image of sheet music is still music.

No it isn't. Sheet music is..... SHEET MUSIC. Tell a conductor sometime
that there is no difference between sheet music and what a concert orchestra
produces when it gets together. By your definition we don't need sound
systems, we just need to read the printed score, after all music is music
right?

>I doubt that these cases I mention will be as vigorously prosecuted
>as a blatant transmission of Beethoven's 5th over the local repeater
>using FM mode and the sound of the music; I just bring up this point
>for you to think about before you try to "loophole" your way around
>the rules (I see no loopholes).

I like the way you phrase your last sentence Phil. Through this whole
posting you state that you are expressing your opinion, you push the
definition of what music "is" to the very limit of Webster's, but in
the end anybody who doesn't agree with you is trying to "loophole"
around the RULES! In one major flash your opinions became RULES.

I not only doubt that the FCC would prosecute for the transmission of
digital FILES containing music programs over ham radio, it is my OPINION
that it is not illegal.

Sorry for being so harsh Phil, but I am getting tired of hearing all these personal interpretations of the "rules". This discussion is just like the "pizza" issue in my mind. Debating these issues is great if you just like to argue, but only the legal beagles can actually settle something like this, and then only after someone has been charged with a violation.

Just please do me one favor. At the end of postings like this, put a disclaimer on it that says "these are my opinions, I could be wrong, I am not a lawyer that is versed in the interpretation of the law and its precedents, arguments over things like this can never be resolved out of a court of law but it sure is a useful way to get everybodies blood boiling!"

+
Yeah - you do have to get the phases right! The phasing networks were
quite fun to design (but that would take too long to describe here, so i
just described them as an 'Adder') and even more fun to set up. Actually
now i dont bother with the phasing part anymore, i just use one sideband - it
saves the 200mA battery drain of the phase-shift networks and filters.
Important thing is, it makes broadcast AM listenable to!

Theres a new Long-wave transmitter started up here in Europe.
On 252KHz, its operating from the top of a mountain near Dublin, in the
Irish Republic. Rumour has it that they run 400Kw to an omni-directional
antenna (they havent replied to my QSL yet!)
They call themselves Radio Atlantic, and are a joint venture between
Radio Telefis Eireann (the Irish Republic's state-run broadcasting body) and
Radio Luxembourg.
They operate during the period 06:00 to 18:00GMT.
Wonder how far their signal goes - anyone in the States or Canada hear them?

I am looking for a source of inexpensive cartographic information
in computer readable form. I would like to use this for
tracking weather phenomena such as hurricanes, with a graphics
display of related land masses, and calculated distances and bearings
from specified landmarks.

Does anyone know where I can get such?

Please reply by email or follow up to rec.ham-radio. I will
summarize responses there (unless someone can tell me a more
suitable newsgroup for this discussion).

Thanks

>My opinion is that it is legal for licensed hams to operate the equipment.
>If a salesman operates the equipment as a part of his job, either to set up
>the station, or as part of an effort to sell you equipment, then he is
>violating rules on business or compensation.

But you have sidestepped the question that is being asked: What if the
salesman is a licensed ham?

Before someone actually goes to the trouble of putting this question to
the wrong people, let me caution that IMHO, some questions are best left
unanswered, and this is one of them. If the FCC is forced to rule on
something like this, they are apt to conclude that it is more dangerous
to try to explicitly exempt this situation than to simply disallow it.
Take the recent discussion of amateur radio weather nets as an example.
Is there anyone out there who would honestly prefer not to have the
privilege of testing new rigs they might be interested in some day
acquiring? If you get what you want, will you want what you have?

I am wondering if someone running a uucp-packet radio gateway could send me directions for it's use? I appreciate that there is a [requirement] for monitoring mail inbound to packet radio.

I would like to be able to send and receive small ammounts of packet mail via uucp. My location is near Rochester NY.

Thanks much.

>>bandwidth-limiting devices built in.
>Well, Jay, I suspect that a number of poeple grow bright purple at the
>thought of ATV right on top of the weak-signal & EME range 432-433 MHz!!!

Including me. I'm not completely an FM type...
That's the exact reason that they need to pay close attention to actual occupied bandwidth on that channel. Since, according to one interpretation of the rules I've heard about, using ATV on 432-438 is illegal, it would stand to reason that allowing a 426-432 signal to slop over into 432-433 is also illegal.
The real problem is that the average ATVer doesn't notice, and the average ATV manufacturer (the aforementioned PC Electronics) is more interested in keeping the price of his radios down than building them so that they can be operated legally.

>We have never seen this degree of filtering in ham radio in the past. The
>ARRL Membership Services Committee seems to have been unaware of this problem
>when they rejected the VUAC 902 MHz band plan and adopted one with wideband
>digital adjacent to weak signal operation, requiring sideband attenuation of
>something over 100 dB per MHz. BTW, 902 is just too narrow to be much
>long-term use for ATV - one channel at most.

I haven't figured out yet why the Membership Services Committee got into band planning in the first place, much less why the Board listened to them instead of people who know what they're doing.

Why is 902 too narrow for more than one ATV channel?

>Or should we just forget UHF DX?

God, I hope not, if for no other reason that that implies forgetting about satellites and repeater linking as well.

2444. TS-440 Comments (Summary)

Newsgroup: rec.ham-radio
Date: 1989-09-04 17:31:36 UTC
From: disd@hubcap.clemson.edu
Message-ID: <6383@hubcap.clemson.edu>
Source record: 17167

Again, I wanted to thank everyone who responded to my request for comments concerning the Kenwood TS-440S transceiver. As planned, I purchased the rig this past Saturday, along with the SP-430 external speaker, an Astron RS-35M power supply, an MFJ Versa-Tuner V, the Kenwood MC-85 Microphone, and a Butternut HF-6VX vertical (with the 160, 17, and 12 m kits). Boy, was that a lot to carry out to the car!!!

There were many requests from people for a summary of the replies that I received. Rather than try to mail directly to all of them, I would like to post it here (I beg the indulgences of net-dom).

First of all, everyone who responded said that they enjoyed the rig very much, and had no problems with it whatsoever. After a few days with it, I can see why... it is a joy to use. Anyone who is in the market for such a rig should certainly give it a good look.

As far as filters go, there was some difference of opinion, but in general the 500Hz CW filter and the 1.8kHz SSB Filter was found to be best, if any filters were necessary at all. The 500Hz filter was good for CW as well as RTTY and other digital modes, the 270Hz a little too narrow for most tastes. The 1.8kHz SSB filter was a little too narrow for some, but others found it great for getting thru the static and obtaining a much more readible signal. I got the 500Hz and the 1.8kHz filters, and I think both are a good set. The rig will choose among the default and optionally installed filters automatically, or you can select the ones you want.

Several people sent me complete documentation on the computer interface, and for that I am VERY thankful. The IC-10/IF-232 set was very expensive, and very unnecessary it turns out. The IC-10 is a two chip set (an 8251A UART and a CD4040 CMOS 12stage counter) that could be mail ordered for less than $2, and the 440S manual tells you how to install them. The IF-232 interface kit just converts the TTL output from the rig to RS232 levels, and there are kits and plans on the market for building those for about a third (or less) than what Kenwood charges.

I saw shareware disks with controller programs for the radio, once the computer interface is in place. However, I was sent the entire instruction/command set, and I will enjoy playing around in coding my own. If anyone is interested, please e-mail and I will try and set the instruction set direct... no need wasting the space here.

Again, thanks to those kind enough to respond, and once I get the butternut on the roof I'll be all set. Time to build my iambic

keyer (I bought a Bencher paddle, and I have the Curtis keyer chip)....
and get my code speed up for my Extra.

Whoops... I hope I haven't brought up the great Code wars again ;-)

Source record: 17169

The ICOM IC-2GAT has both sets of off-sets built in.
There is a software reset that is in the manual which can
switch the HT between the 2 modes (you do lose all the programmed
memories when you switch though.) However, i think that the
tone burst is wrong. there is an IC-2GE, and it would have the
correct European stuff, and may also have the capability of switching
offsets. You would have to check with a dealer to be sure, since i
don't have my manual here with me.

2446. Counter LSI chips

Newsgroup: rec.ham-radio
Date: 1989-09-05 03:55:38 UTC
From: jvb7u@astsun.astro.Virginia.EDU
Message-ID: <1961@hudson.acc.virginia.edu>
Source record: 17170
Cross-posted to: sci.electronics,rec.ham-radio

I am looking for LSI counter chips similar to the AMD 9513. It does almost
everything I need except hardware control of the load and up/down functions.

For those not familiar with the AMD 9513 it has (among other features):

5 16 bit up/down presettable counters which may be concantenated
in almost any fashion desired.

each counter may be preset from software and gated in a variety of
modes from software or hardware.

Does anyone out there know of anything similar to this chip?

Jon

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

2449. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1989-09-05 04:56:00 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8909050706.AA02610@ucbvax.Berkeley.EDU>
Source record: 17173

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

[etc.]

OK, you're right, I was way off base viewing your screed as an attempt
at having a law. What you're describing is a conspiricy, the point of
which is to prevent the lawful ownership and use of radio gear by
non-hams through the use of economic force by hams. I'm glad you
cleared that up for me.

I am still thankful that it has no future beyond pointless network
wrangling (like this) and the comically eccentric behavior
on the part of people who try to get radio stores to go along with it.

From: rfc@briar.philips.com
Message-ID: <63077@philabs.Philips.Com>
Source record: 16986

copied from packet:
Msg# TSP Size #Rd Date/Time MsgID From To
2364 BN$ 1442 0 0902/1001 1817_W6PW WD6EOS ALL@WA2RKN.NYNET
Sb: USING STD PC KBD WITH WYSE

I would be very surprised if there were not other people out there, like myself, who own a Wyse 2112 or similar PC-compatible computer, and would like to use a different keyboard than what Wyse supplies.

It can be done; any IBM PC, XT or AT style keyboard using a DIN connector will work with these machines. However, since mine was missing the 4-pin modular to 5-pin DIN adaptor, I had to build one. The interconnections are as follows.

WYSE MODULAR CORD WIRE COLOR: FUNCTION: CONNECT TO DIN PIN:
RED +5V 5
GREEN CLOCK 1
BLACK DATA 2
YELLOW GROUND 4

Any electronic supplier should have the 5-pin DIN female. I have used this mod very successfully with my 2112 and a Mitsumi enhanced AT-style keyboard. In order to preserve the original functions of the Wyse keyboard, I do recommend the use of a 101-key enhanced AT version.
Best of luck!

> via uucp. My location is near Rochester NY.
>
> Thanks much.
>
> -Val Christian (N2EPO)
> ...attctc!swamps!val
> ...rochester!kodak!swamps!val

I can handle your traffic. The format is quite easy. Mail your messages
outbound to:

...!texbell!ark!lrark!argate!unetadm

With the following format:
Sx <to> @ <bbs> < <from_your_call> $<bid>
<subject>
. #
. # x is the type B - Bulletin, P - Private
text # or T - NTS traffic
. #
.
/ex

So, a message to w2xyz from you could be:

SB W2XYZ @ W2AAA < N2EPO $N2EPO_1
Hello, got an access
Hi Elmer,
I thought I would say hello to you. Long time no hear. You can
contact me via packet at N2EPO @ WD5B. Val, N2EPO @ WD5B
/EX

When received, it will flag it as okay and it will be picked up by my
gateway system (WD5B), normally done on a daily basis. . Replies may
be mailed directly to you for those received here. Use your return
packet address as N2EPO @ WD5B. Return mail will be automaticly forward
to you via uucp.

I have written a script file that will prompt for the information and make things a little more organized on your end. Will pass that along as soon as I get a little documentation included.

2455. Scanner Magazine

Newsgroup: rec.ham-radio
Date: 1989-09-05 18:14:00 UTC
From: trd10523@uxa.cso.uiuc.edu
Message-ID: <121900046@uxa.cso.uiuc.edu>
Source record: 17176

Can anyone out there recommend a good magazine or other periodical that is
(preferably) devoted to scanners?
If possible, please provide subscription information (like an address).
The only thing I've heard of is Monitoring Times - are there any opinions
about it, and where are they?

Please email replies - my system throws away anything that's more than a
couple weeks old.
Send to: trd10523@uxa.cso.uiuc.edu

Thanks in advance.

Thought someone might be interested in trying this. I will also be writing a routine to read uNET mail format for messages that you receive. For my log, anyone wanting to use the gateway please send me your full address and what class license you are.

Below is a routine that will allow access the packet network via WD5B Gateway. It is a kludge, but am interested in seeing how the system will work. Sorry, do not have a program to create a shar file. Cut along lines with appropriate file names. Any questions to Richard Duncan WD5B @ WD5B.

No flames, RTFM's, dummies or other self-defeating comments. This is one of my first shell scripts, any corrections or help would be appreciated.

Documentation (as much as there is!):

UM
A mailer script for uNET uucp -> packet Gateway

UM is a short script to allow individual users access to amateur radio
packet via uucp mail. The mail should be addressed to argate!unetadm.
The system is self prompting. Edit the file to put your personal information
like callsign, zip local system!username and on down in the routine your
favorite text editor (vi is default).

1. Create directory mailer in your area and a subdirectory of address:

```
mkdir mailer
mkdir mailer/address
```

2. Put UM in ./mailer. Make sure you chmod um to execute.
3. Create a file to handle message numbers in ./mailer:

```
cat > umailder.nbr
0
<ctrl-d>
```

4. Go into ./mailer/address and construct your addresses by a
keyword. This can be any single word. UM will prompt for the
mailing address and use this keyword to get the path.

For example:

```
cat > argate
texbell!ark!lrark!argate!unetadm
<ctrl-d>
```

You may create any number of addresses depending on the various
system you want to send the message to.

That's it. UM will prompt for the information that it wants and
use the information you put in the script to configure it for your
system. This will get things started. You may now send mail to
the system. I will read the mail as unetadm and place the file
in a directory that will allow uNET to pick up the message and
distribute it out on the packet network, whether destined locally
or around the country/world. Naturally, this is going to require
a little knowledge of packet on your part as to distribution, etc.
I will help as much as I can.

In the Arkansas area, we have the following bbs systems:
WD5B Arkansas Gateway
KC5JH Primary user bbs in Little Rock
N5ALU Ft. Smith
KA5BML Springdale
KD5LF Cherokee Village

Let me know of any questions and/or comments.

}ux1.cso.uiuc.edu!phil@uxc.cso.uiuc.edu (Phil Howard) writes:
}
}>Since the wording of the rules refers to "music" with no qualifications,
}>I personally suspect that it can be interpreted to mean that music in any
}>form cannot be sent.
}
}TORCH ON:
}
}That's nice, but who cares what your suspicions are? Can you provide
}ONE EXAMPLE of ANYONE being CHARGED with a violation under this law for
}transmitting anything besides ACTUAL ON THE AIR MUSIC?

I belive there was indeed such a case documented in QST earlier this year. Someone trying to broadcast on 40 Meters as I recall.

}What do you call all those neat little 3 octave courtesy tones that you
}hear on the repeaters. Look at the parameters for a courtesy tone on an
}RC-850 controller. Talk about composing a "tune".

The fact that it is not enforced in one case in no way makes it legal!

}Sorry for being so harsh Phil, but I am getting tired of hearing all these
}personal interpretations of the "rules". This discussion is just like the
}"pizza" issue in my mind. Debating these issues is great if you just like
}to argue, but only the legal beagles can actually settle something like
}this, and then only after someone has been charged with a violation.
}
}Just please do me one favor. At the end of postings like this, put a
}disclaimer on it that says "these are my opinions, I could be wrong, I
}am not a lawyer that is versed in the interpretation of the law and its
}precedents, arguments over things like this can never be resolved out of
}a court of law but it sure is a useful way to get everybodies blood boiling!"

Meanwhile the FFC rule is quite simple and unambiguous: "the transmission of music is forbidden". No exceptions, no loopholes.

You obviously disagree, and you have a right to an attourney and you can try to convince a judge that you are right. Its your hide (and license) that is on the line, unlike the "pizza patch" case.

Like driving 90 mph down a city street, you can argue that the law is imoral etc., and you can argue that you won't get caught, but the law still says there is a speed limit. You don't have to be a lawyer to know that!

>Radio Luxembourg.
>They operate during the period 06:00 to 18:00GMT.
>Wonder how far their signal goes - anyone in the States or Canada hear them?
>
>
> de G6WBJ

A few additional fact/corrections:

"Atlantic 252" is currently on 254 kHz - they intend to move down to 252 'soon'.

Transmitter power is (I think) 500kW to a antenna on an 830ft tower.

Operating times are 0600 to 1900 BST. (I assume this is because Luxembourg
dont want Atlantic taking listeners from their own sevices)

The name used while the station was in the conception stage was "Radio Tara".

No reply to my reception report either!

Mark

2459. Interference on 2454 MHz (extraterestral ?)

Newsgroup: rec.ham-radio
Date: 1989-09-05 21:03:50 UTC
From: michael@fe2o3.UUCP
Message-ID: <222@fe2o3.UUCP>
Source record: 16990

We have been operating Television Point to point links across the U.S. for
a number of years and have noticed a puzzeling interference on 2.5 GHz
channel 8A (2454.5 MHz).

The Interference is irregular in form (i.e. doesn't look to be
intelligently modulated), it covers about 10 MHz, varies in intensity
and is noticeable almost everywhere we go across the U.S. and Canada.

Has anybody got any ideas what we have here? Does anyone
know if there is are solar radio emissions at this frequency?

Any help would be appreciated!

>OK, so I'm wrong (Jay Maynard points out that more than ATV channel
>possible on 902).

You may know more about it than I do; I was genuinely curious: is there a problem with more than one (6 MHz) ATV channel on 902? Too much other activity?

> I guess we agree, Jay, that the 1.3 GHz band
>does have more space, and isn't much harder to get on.

True. The ATVers probably could have all of 1240-1270 - 5 channels - and nobody'd be displaced.

> 73
> Gene WA1UXA
>----------

Heard a QSO with a JA ham the other day in which the JA was using a new Kenwood 950. He described it as a 940 with a band pass monitoring capability built in. (i.e., a panadaptor a la Icom 781.) Only, the radio does not have the monitor built in. You hook up a video monitor (NTSC ??) to the video out and view the band on any size monitor you would like. The bandwidth is settable to 50, 100, 200 kHz wide. He did say what the JA cost was, but I dont remember. I did not listen much more, so I did not get all the particulars as he continued on about the other different features.

Kenwood has not been keeping up their part of the rig of the month club. It probably is time for them to bring out a new HF rig.

More information on the IC-2GAT.

To RESET the CPU (and wipe out memory), hold the LIGHT button AND the FUNCTION button while CPU is on, then turn it off, wait a second, and turn it back on. Continue holding the buttons while all the LCD segments display until "46.01" shows (about 1-2 seconds). This puts the radio into 5/10/15/20/25 khz step mode. Its starts in 15 khz steps and other steps in the list may be chosen. I wish 30 khz were in the list.

The instructions for the IC-2GE are similar except that you hold down LIGHT and the WR button on top right next to the power switch. The IC-2GAT also performs this same reset, and also enters the 12.5/25 khz step mode. The step starts at 25 khz. When it is set to 12.5 (the only other choice until you reset the CPU the first way) you can dial up frequencies like 146.0125 which shows like "46.0125" where the "25" are BOTH smaller digits. The "5" never shows in the "American mode". The display goes to "46.01" in the "American mode" and to "46.00" in the European mode.

Another curiosity is that when I RESET my CPU, I did so while it was tuned to 162.55 (weather). When I turned the power back on, EVERY segment was displayed, but the radio was actually receiving 162.55 anyway. Then when the reset finally took effect, the display went to "46.01" and the weather signal was lost. I also notice that sometimes, the "U" for synthesizer unlock (in the 10's position of the memory number) shows up just at the moment the "46.01" or "46.00" does, then ends in a second. I guess the sythesizer is being reset as well.

I doubt we can ever get legally binding. The closest thing we CAN get is to
have an organization that has representation of ALL amateurs, not just those
who like the ARRL's current policies, that will make spectrum planning and
usage RECOMMENDATIONS. Then we can legitimately call anyone out of the plan
a LID.

> Or should we just forget UHF DX?

Definetly NOT.

> Including me. I'm not completely an FM type...
> That's the exact reason that they need to pay close attention to actual

> over into 432-433 is also illegal.

It's not illegal. It is strongly discouraged due to the satellite band at
435-438 Mhz. Repeaters are definitely NOT legal on 435-438 Mhz, so that
includes ATV repeaters as well. ATV on 432 Mhz is certainly NOT WELCOME.

> The real problem is that the average ATVer doesn't notice, and the

> >long-term use for ATV - one channel at most.

What would you rather have adjacent to a weak signal area? At least digital, being narrower than ATV, would be preferrable to ATV. I think narrowband links would be best.

> Why is 902 too narrow for more than one ATV channel?

There are 2 now, and the new 33cm plan just moved them 1 Mhz.

> >Or should we just forget UHF DX?
>
> God, I hope not, if for no other reason that that implies forgetting
> about satellites and repeater linking as well.

It's not dead yet. But ARRL stills needs to be "taken out back".

Hasn't anyone considered using a Costas loop as a synchronous AM detector? They're commonly used for demodulating binary PSK (digital) signals, and in modified form for higher levels of PSK. They work just fine on AM or AM with suppressed carrier, because binary PSK is nothing more than suppressed carrier AM with a binary modulating signal.

The advantage of a Costas loop over the method described here (extracting the carrier with a narrow filter) is that the entire power of the signal (carrier plus both sidebands) is available to the receiver for generating the local carrier reference. This has the advantage of being much more resistant to selective fading that takes out the carrier.

Amen!

Anyone who even thinks of calling for more regulation of amateur radio by the government should first read the excellent article in the September 1989 QST entitled "Tune in to Glasnost". The problems Soviet hams have in getting permission to do even the most innocuous of things (like operate portable) ought to give pause to anyone harboring such thoughts.

Have them learn the characters FIRST, at a much higher speed, like
13-15wpm, then space out the characters with a space of 5 wpm, or so. That
is what I did, and I was 30wpm, in no time flat (about 6 months)

All that's true, but the 'license' is actually more in the nature of a receipt indicating you paid the annual tax that goes to supporting the BBC. Regulating radio listening or TV viewing is not the purpose of it.

I don't know why everyone is so concerned about QRM from wideband digital links. Take a look at the spectrum analyzer photos on page 74 of the 6th ARRL Computer Network Conference proceedings. The WA4DSY modem's spectral density in a 3 KHz sampling bandwidth is down 30 dB from its mid-band level at about +/-50 KHz, down 40 dB at +/-60 KHz, and down 50 dB at +/-90 Khz. At about +/- 120 KHz, it hits the noise floor of the spectrum analyzer, 60 dB below the mid band level.

Since the modem uses a scrambler, it emits no discrete spectral lines; the signal resembles wideband noise, all the better to bury itself below your receiver's noise floor. This is quite unlike an ATV signal with its strong line components at every multiple of the horizontal rate.

Phil

2471. Transmitting Music for ATV

Newsgroup: rec.ham-radio
Date: 1989-09-06 08:07:08 UTC
From: mgb@APG-TECNET.APG.ARMY.MIL

*Mike Waters writes:
>mgb@apg-tecnet.apg.army.mil (Mark Bitterlich) writes:
}ux1.cso.uiuc.edu!phil@uxc.cso.uiuc.edu (Phil Howard) writes:

}Since the wording of the rules refers to "music" with no qualifications,
}I personally suspect that it can be interpreted to mean that music in any
}form cannot be sent.

>That's nice, but who cares what your suspicions are? Can you provide
>ONE EXAMPLE of ANYONE being CHARGED with a violation under this law for
>transmitting anything besides ACTUAL ON THE AIR MUSIC?

*I believe there was indeed such a case documented in QST earlier this year.
*Someone trying to broadcast on 40 Meters as I recall.

Mike would you please read what I said? I was talking about being charged
for transmitting something besides actual MUSIC as in DO RAH ME FAH SO LA
TEE DO. The gent you are talking about was transmitting AUDIO music. He was
not transmitting a binary file on packet radio that when loaded into a
computer played a tune on the computers speaker. He was transmitting real
time music. I agree that real time music is illegal, I never said other-
wise. The issue is not about that, it is about transmitting digital data
that makes a PROGRAM play a tune on a computer, or transmitting a FAX or
ATV IMAGE of a sheet of music. The ham on 40 meters was NOT charged with
doing that. Are you confused or what?

>What do you call all those neat little 3 octave courtesy tones that you
>hear on the repeaters. Look at the parameters for a courtesy tone on an
>RC-850 controller. Talk about composing a "tune".

*The fact that it is not enforced in one case in no way makes it legal!

AH HA! So you believe now that courtesy tones are music and are illegal?
This is absolutely ludicrous Mike. I am sure a few thousand repeater
owners would disagree, and since the FCC is not violating anyone for
having a 3 tone courtesy tone, I would think that by this time you could
say it was legal! When you say that the FCC is not ENFORCING the issue
you ASSUME that you are correct in your INTERPRETATION of the law. They
might not be violating people because they never meant the law to be
interpreted in the way that you do, as in "Gee Mike, you may be wrong".
Now... what are you going to do about paging tones... another case of
MUSIC right? :-)

*Meanwhile the FCC rule is quite simple and unambiguous: "the transmission of
*music is forbidden". No exceptions, no loopholes.

I agree Mike... 100% You are RIGHT. And guess what? A digital file is not music, neither is a FAX, nor a RTTY transmission. In order to transmit music, you have to do it in real time with AURAL reproduction. This is my OPINION, it obviously does not agree with yours, but since the FCC has only nailed people that transmit AURAL MUSIC in REAL TIME ON THE AIR, I'd say that I have a pretty good leg to stand on. Of course you will say that the FCC is simply not enforcing the law. I say that they are not enforcing YOUR law. Thank goodness.

*You obviously disagree, and you have a right to an attorney and you can
*try to convince a judge that you are right. Its your hide (and license)
*that is on the line, unlike the "pizza patch" case.

Well since NO ONE has been convicted of transmitting music when they sent a FAX of a printed page with musical notes on it, and NO ONE has been violated for sending a binary packet file that plays tones on a computer at some later time, I don't think I have to sweat it much. But it would be a lot of fun to explain it to a judge and I welcome the opportunity. Why don't you call the FCC and violate me. I'll make it easy and say that I've already done it (transmitted a binary file on packet radio that made a program in an IBM clone play music), I'll be waiting with bated breath. And MIKE, this is JUST LIKE the pizza issue since it is all about an INTERPRETATION of the law.

*Like driving 90 mph down a city street, you can argue that the law is immoral
*etc., and you can argue that you won't get caught, but the law still says
*there is a speed limit. You don't have to be a lawyer to know that!

Mike, if the SPEED LIMIT was 25 MPH and I sprinted down the sidewalk on foot at 26 MPH, you'd probably give me a ticket wouldn't you?

And please don't put words in my mouth, as you can see I have plenty of my own! I NEVER said that the law was IMMORAL, and I NEVER argued that you would not get caught, and I NEVER argued that you could transmit audio on the air in the form of MUSIC. I simply said that a BINARY FILE is not music, that a FAX is not music, and RADIO TELETYPE is not music.

You can argue this to death, but there are a few things that emerge as truth (in my eyes) and these are:

Those who seek to find infractions of the law will always be successful.

Interpretations of the law PRO or CON don't mean diddly squat until put to the test in court.

------------------FLASH....LATE NEWS ITEM!-----------------------------
Ham radio operator develops program that takes packet radio transmissions and turns them into MUSIC on his computer. FCC says that packet radio is now prohibited since ALL of it is MUSIC! :-)

The interference is probably from microwave ovens. There are three bands allocated for microwave ovens, one of which is 2450 MHz. I forget the other two, except that one of them is down around 800 or 900 MHz or so, if I remember right. Also don't remember the tolerance or bandwidth.

Just to set the record straight on the U.K. 'radio tax'.

There is no license necessary for radio (audio only) receivers.
T.V. receivers must be licensed. You only need 1 license per household,
NOT per set. Colo(u)r costs more than monochrome. You do not need
a license if your set cannot receive BBC TV transmissions, so a HAM ATV-
only receiver would be free. Of course, all commercially sold sets get
the BBC frequencies.

As has been said, it is the sole source of revenue for the BBC. For your
money you get 2 national TV channels, 4 national radio channels, and
probably at least one local radio channel, depending on where you live.
All commercial free, and for the cost of a couple of months cable...
The money also pays for the World Service (I think).

Mike.

2477. Article on the ECPA

Newsgroup: rec.ham-radio
Date: 1989-09-06 16:02:42 UTC
From: MEHARP01@ULKYVM.BITNET
Message-ID: <8909061909.AA17995@ucbvax.Berkeley.EDU>
Source record: 17002

There is a very interesting article in the August 28 issue of "Network World."
This article is a review of the events leading to passage of the ECPA.

What's interesting is that this article points out in a very non-subtle way
that the ECPA is really a whitewash and that it did nothing to prevent
people from monitoring cellular phone calls. It even quotes an unnamed
Justice Department official as saying that "they have no intention of
trying to enforce" the ECPA. Also, to the relief of hams everywhere
(especially the overly sensitive lot we find here on the net :-)) they
DO NOT refer to scanner owners as "ham radio" operators. The author, Robert
Corn-Revere, even points out that an UHF TV tuner can pick up cellular calls.
I didn't know that.

The big kicker is that this author, who practices communications law in DC,
all but says that the cellular industry is conducting an intentional
disinformation campaign to hide the insecurity of cellular phones.
This is gutsy since some of his firm's clients may not like that
implication.

The article is in a reddish box on the bottom of the front page. It's too
long to type in. Enjoy.

Gee, I know where _I'd_ look first!

Guess what frequency most microwave ovens operate on? 600 watts out of
a magnetron free-running oscillator into a small but still slightly
leaky cavity... with very poor frequency control!

I'm surprised that video relays still operate in that area, since it's
an ISM allocation (spectrum trash heap) or close to one.

Subject: Safety First

Ahhh, time to sit back on this lazy day and read the ham mags!
First I look at the cover of 9/89 WORLD RADIO. Well - I say to my
cat - after all, it IS Field Day and we all stretch the limits to
get things up and running for the big day. Sure wish those two
fellas could have found some folks to steady their ladders though.
Standing on either of the top two rungs of a folding ladder is a
bit dangerous. I think the shop teachers say it's verboten.
OK, OK, lighten up. I finish reading WORLD RADIO, time to grab
the 9/89 issue of 73 and see what antenna lessons I can pick up.
Whoa! Pierre asks me to explain this cover photo! I tell her that
the lady pictured on the tower surely has her left foot on the
ground, otherwise she would have her climbing belt on. We hams never
go up in the air without one.
Let's face it, safety is important and our national magazines
should take the responsiblity to present that concept to the public
as well as to other amateurs.
So much for my cover photo critque. I gotta go and work on Pierre's
concept of safety, she says her claws are all she needs to scale
that 80 foot oak out in back!
It's OK to flame me, but let's leave the cat out of it.
After all, she's just naturally curious.

I sure hope so! When we first got KA9Q's TCP/IP going on the air here,
the very first test file we transferred was an IBM PC music program
called PYTHON.COM.

Waiting for the Radio Police to come charging in as I listen to
cellular phone calls while FTPing PianoMan programs...

2483. Double Ducky Update

Newsgroup: rec.ham-radio
Date: 1989-09-06 18:54:58 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <164152@Wayne-MTS>
Source record: 17014

Some time ago I ordered the "Double Ducky Direction Finder" kit from
circuit specialties. It arrived shy the instuctions, so I called back
and yesterday the package was complete....sort of.

First, this ain't no Heathkit, but I didn't expect that. It is a set of
parts and PC board pieces that are soldered into a case. The only instrcutions
given are in the form of a crude drawing showing roughly where the parts
should go. The actual PC board is etched into one side of the case; no
holes are drilled, so you must *carefully* place parts, wires, etc into
their proper position and tack solder...if you've guessed right about the
layout.

Challanging, to say the least. There are a few problems: The QST article
(also in the Antenna Handbook) specifies 1/2 wavelength phasing lines
to the ducks, and only about 1/2 wave of wire is supplied for both. Also,
the PC pads for the 567 chip have a few pads coming out from pin 1 of
the 567...which is N/C on the schematic.

My biggest complaint is that once the case is assembled it is virtually
impossible to do any repair if a wire comes loose, or a pad lifts or the
chip needs replacing. I say virtually, as I did it, with much sweat
and saliva.

Anyways...I'm 90% through the job as I write this (I'm taking another
break so my hands stop trembling) and now the thing won't oscillate. Grr.
More later...

2484. State Variable Filters

Newsgroup: rec.ham-radio
Date: 1989-09-06 20:01:44 UTC
From: charlie@oakhill.UUCP
Message-ID: <2376@radio.oakhill.UUCP>
Source record: 16996
Cross-posted to: sci.electronics,rec.ham-radio

I have a question for the netland filter jocks out there...

For years I have seen a 3 op-amp filter structure known as a 'state variable' or 'biquad' filter. The filter provides simultaneous highpass, lowpass, and bandpass outputs. I understand how the filter works but WHY is it called a 'state variable' / 'biquad' filter???

State variables come from linear system theory ... why does this filter attract the name? can't any filter have state variables??

Biquadratic relates to the fact that the filter has 2 integrators making it 2nd order...o.k. lots of filter structures can be 2nd order and they don't even need 2 op-amps to be 2nd order! So why the name biquad?

Trivially yours,

Charlie -- WB4HVD

2485. Geophysical data by radio ?

Newsgroup: rec.ham-radio

(I asked this question a while back, but I believe it got lost)

As part of an auroral monitoring system we want to receive geophysical alerts of the type broadcast by WWV.

1 Does WWV broadcast these in a machine decodable format at any time (ie not as speech) ?

2 Do you know of any other station (receivable in England) which does broadcast such information in machine readable form. Frequency doesn't matter much, we can listen most anywhere

Please reply to djch@maths.bath.ac.uk, or post to news if you can't get through.

Many thanks
David Hutchinson G8SQH

2486. Fast Food Frequencies

Message-ID: <8909062116.AA19222@cmr.ncsl.nist.gov>
Source record: 17015

Someone asked about sources for map data. Four collections are listed in
the PBS catalog of "free" software that they sell for $5 a disk. They are:
RD9.0 US Map Data 15,000 points for mapping USA
RD24a-d World Data Bank 179,000 points from CIA database
RD25a-c World Digitized >100,000 points
HR3.2 Ham Radio 3 Includes "World" which produces maps
for any place in world, great circle
distances, hurricane tracking.
No guarantees given by me. Since these are PD or shareware programs or data,
they are doubtless available for downloading. For example the World Digitized
is on Simtel20.

I have an AEA PK-232 which I just love for all the things I do with it (I use nearly every one of it's modes) an I have the PC PAKRATT software which isn't too bad.

HOWEVER, the FAX option is a joke. I own PC FAX as well. First, there is no grey scale, so copying anything but weather maps isn't too interesting (as if weather maps were). Second, the FAX mode in the PK-232 is brain dead and will not transmitt the data in a reasonable format (it's designed to have a cheap PC printer connected to it). What it does is dump the data formatted for a PC printer and the PC FAX program emulates the printer to decode the data to put on the screen. Gag me. They decided that no one would ever want to display things at the wrong aspect ratio, so they throw away scan lines that it is never possible to stop so that things will look nice on your Epson POS printer.

-Ron

I believe most microwave ovens operate in this range of frequencies,
so it's possible you are hearing one of the primordial sounds of
modern living. However, it seems such signals would have a strong
60 Hz component that would be obvious, so maybe you're hearing
something else. Microwave ovens are ubiquitous, however.

2490. Regency MX7000/MX5000 quirks

Newsgroup: rec.ham-radio
Date: 1989-09-07 05:14:34 UTC
From: gkd@wpi.wpi.edu
Message-ID: <3861@wpi.wpi.edu>
Source record: 17016

I noticed an amusing phenomenon on my MX7000 the other night, perhaps someone else with a '7000 or a '5000 can try this and let me know if it is just my radio that does it:

Turn the scanner on. Press manual, stopping the scan on any channel. Press and hold the up or the down button so that you are in the manual search mode. While continuing to depress the up or the down button, turn off the scanner.

My unit seems to think it's still on, and the display continues searching until I release the button, whereupon it reverts to the clock. The scan speed and delay buttons even work. If I disconnect the power cable instead of turning off the scanner using the on-off switch, the microprocessor is reset and the scanner must be re-programmed.

In addition, here is a handy way to get the scanner to automatically stop searching when it hits an active frequency and remain there until it is re-started manually. I wrote this up for Monitoring Times; it appeared there a couple of years ago.

With the scanner stopped on any channel using the MANUAL key, press CLOCK SET followed by ENTER. Now enter at least one numeric digit, but do not press ENTER after keying in the digit(s). Instead, press SCAN. If you shut the scanner off, you will notice that the clock is not running. The digit(s) that you entered is displayed. Now use the search feature as you normally would. When it hears a signal, it will stop and remain on that frequency. After the signal ceases, pressing any key that would normally give you an "error beep" (such as the ENTER key) will restart the search from where it left off. If you do not wish to wait for the signal to go away before restarting the search, press the UP key until it is gone, then press a key to produce the "error beep."

To re-start the clock after you're through using the search-hold feature, just use the normal clock-set method. Incidentally, the priority feature will not work if the clock is not running.

}}ux1.cso.uiuc.edu!phil@uxc.cso.uiuc.edu (Phil Howard) writes:
}
}}Since the wording of the rules refers to "music" with no qualifications,
}}I personally suspect that it can be interpreted to mean that music in any
}}form cannot be sent.
}
}>That's nice, but who cares what your suspicions are? Can you provide
}>ONE EXAMPLE of ANYONE being CHARGED with a violation under this law for
}>transmitting anything besides ACTUAL ON THE AIR MUSIC?

}*Meanwhile the FCC rule is quite simple and unambiguous: "the transmission of
}*music is forbidden". No exceptions, no loopholes.
}
}I agree Mike... 100% You are RIGHT. And guess what? A digital file is
}not music, neither is a FAX, nor a RTTY transmission. In order to transmit
}music, you have to do it in real time with AURAL reproduction. This is my
}OPINION, it obviously does not agree with yours, but since the FCC has only
}nailed people that transmit AURAL MUSIC in REAL TIME ON THE AIR, I'd say
}that I have a pretty good leg to stand on. Of course you will say that the
}FCC is simply not enforcing the law. I say that they are not enforcing YOUR
}law. Thank goodness.

You could be right, or the FCC just hasn't bothered yet.

}*You obviously disagree, and you have a right to an attorney and you can
}*try to convince a judge that you are right. Its your hide (and license)
}*that is on the line, unlike the "pizza patch" case.
}
}Well since NO ONE has been convicted of transmitting music when they sent
}a FAX of a printed page with musical notes on it, and NO ONE has been
}violated for sending a binary packet file that plays tones on a computer
}at some later time, I don't think I have to sweat it much. But it would
}be a lot of fun to explain it to a judge and I welcome the opportunity.
}Why don't you call the FCC and violate me. I'll make it easy and say that
}I've already done it (transmitted a binary file on packet radio that made
}a program in an IBM clone play music), I'll be waiting with bated breath.
}And MIKE, this is JUST LIKE the pizza issue since it is all about an
}INTERPRETATION of the law.

All of which is how lawyers get rich billing $100+ per hour. To be fair, they do a lot of "behind the scenes" work for every billable hour, but you sure WON'T get rich from it!

}*Like driving 90 mph down a city street, you can argue that the law is immoral
}*etc., and you can argue that you won't get caught, but the law still says
}*there is a speed limit. You don't have to be a lawyer to know that!
}
}Mike, if the SPEED LIMIT was 25 MPH and I sprinted down the sidewalk on
}foot at 26 MPH, you'd probably give me a ticket wouldn't you?

I do know of a cyclist ticketed for doing 35 mph in a 25mph zone, I see no reason a runner couldn't be. Believe it or not sometimes laws really do mean just what they say.

}I simply said that a BINARY FILE is not
}music, that a FAX is not music, and RADIO TELETYPE is not music.

Interesting theory, how do you classify a digital CD? It is after all just a binary file.

}You can argue this to death, but there are a few things that emerge as
}truth (in my eyes) and these are:
}
}Those who seek to find infractions of the law will always be successful.
}
}Interpretations of the law PRO or CON don't mean diddly squat until put to
}the test in court.

Yes true, I'm just as happy to watch you take all the risks for what I see as absolutely no gain.

I think tilting at windmills might be more fun and just as productive.

2493. Crystal Radios

Newsgroup: rec.ham-radio
Date: 1989-09-07 12:35:52 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <164311@Wayne-MTS>
Source record: 17013

This was prompted by KA7TXA's inquiry, but I thought it might be of general interest:

My first crystal radio was built from a description of radios built by American POWs in WWII, using a razor blade for the detector and a safety pin for the cat's hair point contact. It's tricky, but it can be done. I think the small amount of oxide that forms on the blade provides the rectification.

The next one was built with a crystal supplied by my father. It was a packaged thing in a 1" cylinder, made sometime in the 20s, I think. He'd been saving it for quite a while! I wish I had it today.

I have seen these packaged crystals, and even raw crystals in the original packages at antique radio shows. I have one such raw crystal in the original package- a gift from K8IGW, a collector and a heck of a guy. I'm keeping it in the original bos on display with my tiny antique collection.

If you're really interested in doing it the old-fashioned way, head to a gem show or a hobby store with mineraology supplies and look for a nice, shiny hunk of galena, a pretty common and cheap mineral. My 1920 Radio Amateur's Manual shows a number of mounting systems and cat's hairs. I would suggest clamping it in a base of some sort and using the finest wire you can find for the cat's hair, soldering the wire to the end of a screw that can be adjusted laterally for contact pressure. You might want to wind the wire into a coil to put a little spring in it.

Be prepared to fiddle with the crystal to find the "sensitive" spots.

If you really want to get basic, make your own capacitor. The old way was with metal foil (ok, use aluminum) and waxed parchment (yes, there's a roll of something similar in the kitchen). Tuning is done entirely with a sliding contact on the coil, or via a "loose coupler" or similar. (I won't tell if you use your dip meter or impedance bridge to check the values...)

The ultimate is making your own headphones or speaker. I have a pair of 1920's vinatge 'phones that use rochelle salts (sound like a girl I used to date...) and I have seen homemade crystal 'phones using this material. First you have to grow the crystals- easy enough if you've ever made rock candy. Fracture the crystal into thin pieces (or use a fine saw) and clamp a slice on one edge between two electrodes. Fasten the other edge to a thin diaphragm (a slice of mica, perhaps?) and the mechanical details are left to the reader as an excercise.

From: tj@XN.LL.MIT.EDU
Message-ID: <1544@xn.LL.MIT.EDU>
Source record: 17019

I found the article, and found it very informative and interesting. I had no idea the fine was only $500 for Cellular Phone listening, as opposed to huge pennalties for wire-tapping. Of course, this fine can be MUCH larger if done for industrial espianage or simular reason.

I disagree with one point. Sure, nobody may have ever had the intention of enforcing the EPCA, and the fine was made much lower than for other types of phone-interception, but now that the industry got the laws on the books, they can have a very easy time making government prosecute offenders. Now that the law is in the books, it's much easier to get the penalties for offenders raised, or force the FCC to actively try to track down offenders.

One thing, About the UHF Television Frequencies....

Someone said that the top of the UHF band is around 800 MHz. Is this true just of the newer sets? I know that it use to be 889 Mhz. My old Radio Shack Electronics Data Book (C) 1972-1978 shows channel 69's sound at 805.75 MHz, while channel 83's sound is at 889.75 Mhz. This seems to cover the cellular range very well, and with a good antenna along an urban expressway, a "peeping-tom" could catch lots of conversations.

2495. General Ham Stack now available, and other stuff

Newsgroup: rec.ham-radio
Date: 1989-09-07 14:14:55 UTC
From: dls@genrad.com
Message-ID: <25809@genrad.UUCP>
Source record: 17021

Hello, fellow Hams,

I have more news for you:

The General Ham Stack is now available in addition to the existing
Novice Ham Stack and Technician Ham Stack. All of them will fit on one
800K diskette. If interested, please send me your name and address and
I'll mail (NOT EMAIL!!! REPEAT NOT EMAIL) them to you. Peter Hayward
will receive the updated stacks soon and may be able to make them
available via FTP, but I cannot provide this facility, so please don't
ask (I get about 6 requests a week for this, sigh).

I took the REAL Ham tests last night. I passed the 5wpm, the Novice
written, the Technician written and the General written. So welcome a
new Technician class Ham (my kids call me a hamster) to your midst.

I have updated the Novice Ham Stack to v1.5 and the Technician Ham Stack
to v1.2. I've also added a new button on the Help card to allow an easy
way to "Compact Stack", since it seems this needs to be done about every
25th time the stack is used. The fixes to the Novice one was just
typographical, the ones to Technician is more serious. Two questions cannot
be accessed because I typed the wrong card name.....I've described these below.

Since it seems that I'm by no means perfect (:-), I'm going to describe
the three major types of bugs possible in these stacks and how to fix
them yourselves, so you can fix them without getting a new stack from
me. Anyone who isn't interested in these stacks, Now is the time to go to
the next article.

There are three major types of bugs in these stacks: 1. Misspelled words
in the question or answers, 2. Incorrect answer choice, 3. Incorrect
card name, causing card to never be accessed.

To fix these stacks yourself (expert HyperCard users, please bear with me,
this is written for an uninitiated user), first do the following (these
commands can be done from ANY CARD in the stack):

1. Ctrl M to get the message box.
2. Type in message box "set userlevel to 5".
3. Type in message box "show menubar".
4A. To correct misspelled words in question or answers, first go to the
card in question....you're probably already there....but if not,
type in message box "go to card "#123"" (assuming you want card #123).
a. Pull down the Tools Menu, then choose Field (top far right ICON).
b. Select the field to fix by clicking in that field.
c. Pull down the Object Menu, then choose Field Info.
d. Unlock Text (click in the checkbox).

e. Pull down the Tools Menu, then choose Browse (top far left ICON).
f. Edit the text in the field as necessary to correct it.
g. Repeat Steps a-c to get to the Field Info again.
h. Lock Text (click in the checkbox).
i. Pull down the Tools Menu, then choose Browse.
CORRECTION COMPLETE.
4B. To correct incorrect answer choice, first go to the card in question...
as described in 4A above.
a. Go to card script, either by holding down Option and Ctrl keys,
then pressing C (only works with HyperCard v1.1 or newer), or
by pulling down Object Menu, then choose Card Info, then click
the Script button.
b. Edit the answer line as appropriate. To choose A as the answer,
this line should be in script:
put "A" into rightone
NOTE that the letter should be capitalized.
c. Press OK button.
CORRECTION COMPLETE (Note this correction will not actually
appear until the NEXT time you come to this card, so it's
not obvious that it has been fixed).
4C. To correct the card name.....this one's more difficult. First you must
figure out what IS the right card name...unless you already know (ie,
I tell you). The symptom of THIS bug is that when you press the NEXT
arrow, nothing happens, but when you press the NEXT arrow a second time,
it goes to the question AFTER the next question. Pressing PREV arrow
twice will get you to the question BEFORE the bad question.
a. To determine the right card name, look at the question number
of the previous question (say 20), add one to it, then type in
the message box:
put item 21 of questlist
b. The correct card name will appear in the message box.
c. Now go to the PREVIOUS card (let's say the card you want is
#122) by typing in the message box:
go to card "#121"
d. Now go to the next card by pulling down the Go Menu, then
choosing Next. DON'T use the NEXT arrows at the bottom of
the cards.
e. Pull down Object Menu, and choose Card Info.
f. Edit the correct name into the card field. It should be a
number sign (#) followed by the card number you want (if this
is the 10th card in the stack the card name will be #8; card
name is always 2 less then its card sequence in the stack).
CORRECTION COMPLETE
5. The stack has now been fixed, and you don't HAVE to hide the menubar
and change the userlevel to use the test, but when you come back into
the stack for the first time after the fix, these will have been set
to their correct state. Here's how to fix these without exiting the
stack:
a. Type in the message box: "hide menubar"
b. Type in the message box: "set userlevel to 1"

NOW, HERE ARE SOME REAL FIXES YOU CAN TRY OUT THE ABOVE STEPS ON:

In the Novice Ham Stack:
1. Go to card "#123" and change the question text (4A). "330" should be "220".

In the Technician Ham Stack:
1. Fix the card name (4C) by going to card "#190", Next, then fixing card name. It was "#188", should be "#191" instead.
2. Fix the card name (4C) by going to card "#181", Next, then fixing card name. It was "82", should be "#182" instead.

Sorry to go on so long, but hope this helps.

> Phil

Interesting idea. However, even at 100% modulation, only 1/4 of the
total RF power is in the two sidebands, the rest being in the carrier.
Also, the average modulation is considerably less than 100%. So I
don't think you would be gaining a whole lot unless the fading was *very*
selective.

Perhaps a slower PLL on the carrier would tide it over during periods of
insufficient carrier. This would be dependent on good VCO stability.

You need a licence to use a television set to receive broadcast stations,
but *NO* licence is required to own or to use a broadcast-band radio receiver.
There used to be a radio receiver licence, but it was abolished in about 1965.

This is also true of Wales and (I think) Scotland.

> the 'license' is actually more in the nature of a receipt
> indicating you paid the annual tax that goes to supporting the BBC.
> Regulating radio listening or TV viewing is not the purpose of it.

This is perfectly true. The BBC is funded by the licence fee. It does not
advertise at all.

> non-hams through the use of economic force by hams. I'm glad you
> cleared that up for me.

The "conspiricy" part of it is not specifically illegal. Boycott's are typically an expression under the 1st amendment.

Also, I do not see it preventing the lawful ownership and use of radio gear by non-hams in the case of candidate hams, as they can still get it via a ham, and can contact the ARRL to find a ham. Dealers who follow my principle can also give suggests, and they probably have a database of hams that have purchased from them anyway.

The ham-candidate trying to buy a radio from a dealer can get a referral from the dealer to a local ham, so I see no major problems.

Sale of legitimate CB's and 49 Mhz stuff would not be affected since anyone can legally use them.

> I am still thankful that it has no future beyond pointless network
> wrangling (like this) and the comically eccentric behavior
> on the part of people who try to get radio stores to go along with it.

Definitely NOT pointless, comical or eccentric, as your "straw man" posting tries to give the impression. I am very serious about this and intend to work on making it happen.

> acquiring? If you get what you want, will you want what you have?

In this case, the question has already been answered by the FCC, in a round-about way, by the fact that there is a specific provision in the rules already regarding obtaining a license for such purposes. I don't have my CFR here with me, so I can't quote chapter and verse.

2502. Kenwood TM-731A firmware bug

Newsgroup: rec.ham-radio
Date: 1989-09-07 16:45:20 UTC
From: jpd@usl-pc.usl.edu
Message-ID: <738@usl-pc.usl.edu>
Source record: 17084

The Kenwood TM731A dual bander has a firmware bug that breaks the 2m VFO scanner in certain circumstances, that is, the 2m VFO scanner won't work properly if certain PL tones are stored into memory 1. So far, all tested 731A's have had this problem. The highest serial number tested was 72713. To demonstrate the problem, perform this experiment:

1. If not already done, load search bounds into memories A and B of the 2m unit. Verify that the VFO scanner works.
2. Change the PL tone for memory 1 to (for example) 91.5:
select memory 1, press F VFO to transfer it to the VFO, then
press F TSEL and select 91.5 Hz PL tone, then store back into
memory 1 by pressing F MR.
3. Set the VFO to a frequency outside the range given in memories A and B, then start the VFO scanning (by pressing VFO for a few seconds).
4. If your radio has the bug, it will alternate between the frequencies stored in memories A and B. If you start the scan while the VFO is within the search range, it will scan up until the top limit is reached, then begin alternating between the two limit frequencies.
5. To restore 2m VFO scanning, program memory 1 with one of the several PL tones acceptable ... the default of 88.5 Hz works fine.
6. The 70cm unit does not appear to have this problem.

>Biquadratic relates to the fact that the filter has 2 integrators
>making it 2nd order...o.k. lots of filter structures can be 2nd order
>and they don't even need 2 op-amps to be 2nd order! So why the name
>biquad?

No, a circuit can be "2nd order" without being "biquadratic", or even,
for that matter, having two integrators. It's the order of the polynomials
in the transfer function that counts (basically, the number of poles/zeroes),
which pretty much translates into the number of reactive components (outside
of things like bypass caps and the like). Two integrators certainly can
make a second-order system, but it's not the only one possible.

Actually, the name "biquadratic" comes from the fact that the design
realizes a biquadratic transfer function; i.e., one of the form

$$F(s) = K \frac{s^2 + (z1+z2)s + z1z2}{s^2 + (p1+p2)s + p1p2}$$

where z1, z2, p1, and p2 are the zeroes and poles, respectively. The
"state-variable biquad" is one name for this three-amplifier realization of
a biquadratic transfer function, but I'm not certain how "state variabte titled
"Would you believe..." in "comp.sys.hp" and get a response written. I'd
hate to see JohnP have to do it :-)

> TORCH ON:
>
> That's nice, but who cares what your suspicions are? Can you provide
> ONE EXAMPLE of ANYONE being CHARGED with a violation under this law for
> transmitting anything besides ACTUAL ON THE AIR MUSIC?

Don't get so uptight. I was telling people about how the FCC wrote the
rules, and was not passing judgement on what can or cannot be sent over
the air.

> What do you call all those neat little 3 octave courtesy tones that you
> hear on the repeaters. Look at the parameters for a courtesy tone on an
> RC-850 controller. Talk about composing a "tune".

BORDERLINE. Personally I don't think it is music, but I still urge everyone
to read the rules, read them CAREFULLY, and decide for themselves. If I were
to put up a repeater, I might just as well put the tones in and not worry
because if it were considered illegal by the FCC, I'm very sure they would
just notify me of their position and let it go with me just changing it.

> >Digital input files for music playing programs is a form of music just as
> >much as an analog waveform of the sonic vibrations is.

> local radio station for rebroadcasting. BRAAAAP! BRAAAAP! BRAAAAP!
> Hey it would sound better than scratching a needle across a record backwards
> and now a days people actually call THAT music! In any case Phil, your
> statement has no basis other than your own personal viewpoint.

Well, of course it is my personal viewpoint, just as your statement is your
personal viewpoint. Why did you think it was anything else? Don't you
read all the disclaimers people put in their .signature files? I quit
putting any in mine because it is generally well known.

> >Even a TV or FAX image of sheet music is still music.
>
> No it isn't. Sheet music is..... SHEET MUSIC. Tell a conductor sometime
> that there is no difference between sheet music and what a concert orchestra
> produces when it gets together. By your definition we don't need sound
> systems, we just need to read the printed score, after all music is music
> right?

The FCC did NOT say "musical sounds". They said "music". SHEET MUSIC, and ACOUSTIC MUSIC, and any other form of music falls under the general category of MUSIC.... and the FCC says "NO MUSIC".

This is reading the LETTER of the law. IMHO the SPIRIT of the law is otherwise but keep in mind that not all prosecutions, and not all convictions, go along with the spirit of the law.

> >I doubt that these cases I mention will be as vigorously prosecuted
> >as a blatant transmission of Beethoven's 5th over the local repeater
> >using FM mode and the sound of the music; I just bring up this point
> >for you to think about before you try to "loophole" your way around

>
> I like the way you phrase your last sentence Phil. Through this whole
> posting you state that you are expressing your opinion, you push the
> definition of what music "is" to the very limit of Webster's, but in
> the end anybody who doesn't agree with you is trying to "loophole"
> around the RULES! In one major flash your opinions became RULES.

You read my words and didn't get the meaning. NOT MY FAULT. Note that "loophole" is in quotes. It's a generic phrase used when people try to figure out ways to do what they want to do when the letter of the law appears, or might appear, to restrict it, or in other cases (not so applicable here) the spirit of the law.

> I not only doubt that the FCC would prosecute for the transmission of
> digital FILES containing music programs over ham radio, it is my OPINION
> that it is not illegal.

OK. We both are entitled to opinions. We both are entitled to follow our opinions. We both are entitled to express our opinions to others willing to listen.

> Sorry for being so harsh Phil, but I am getting tired of hearing all these
> personal interpretations of the "rules". This discussion is just like the
> "pizza" issue in my mind. Debating these issues is great if you just like
> to argue, but only the legal beagles can actually settle something like
> this, and then only after someone has been charged with a violation.

Well, you are going to have to get used to it because that's the way the legal system works. The opinions that actually count in the end are those of the judges and juries, and they are determinations of when and how particular cases apply to particular law. In the mean time, WE THE PEOPLE have to figure out which particular cases we might be involved with apply to particular law. We can hire lawyers to research this for us, but even then the final responsibility is our own.

> Just please do me one favor. At the end of postings like this, put a
> disclaimer on it that says "these are my opinions, I could be wrong, I
> am not a lawyer that is versed in the interpretation of the law and its
> precedents, arguments over things like this can never be resolved out of
> a court of law but it sure is a useful way to get everybodies blood boiling!"

Here's a better one:

These are my own opinions, damnit, and if you can't figure that out, then just put my name in your kill file and quit sweating over it.

Brian Kantor, WB6CYT
.R
.sp 2
.ce 0
.LP
The TS440 is nice. Here's what I've found out about it that isn't in
the operation manual (in some random order):
.KS
.SH
Diode Options
```

.LP
There are a bunch of configuration options controlled by
clipping or inserting diodes on the back of the control board. You get
to it by taking the top and bottom covers off (a bunch of silver
screws), loosening the front panel (4 flat-head silver screws, NOT the
black ones!), and removing a shield cover (loosen 5 small silver
screws). Then you have:
.TS
expand doublebox allbox center;
c s s s
c c c c
c l l l.
.B
TS-440 Diode Configuration Options
=
.I
diode controls in out (cut)
.R
D65 mode confirmation Morse single feep
D66 display resolution 100 Hz 10 Hz
D67 memory protect none on
D73 CW shift 800 Hz 400 Hz
D78 WARC 24MHz band tx disabled enabled
D79 WARC 18MHz band tx disabled enabled
D80 General Coverage tx disabled enabled
.TE
.KE
.SH
Data and AFSK
.LP
Someone wanted to know what the difference between the DATA connections
on ACC-2 and the AFSK connectors was. On output, none; the AFSK and
the DATA out pin on ACC-2 are connected together, and are fed from the
high side of the volume control - the are receiver audio BEFORE the cw
sidetone, feeper, and voice response unit are mixed in, and should be a
constant level independent of the AF gain setting. The AFSK input is
different from the DATA IN connection; AFSK and microphone signals both
go through the mike preamp and speech processor; the DATA input
bypasses both. The MIC GAIN pot does control all three input levels.
(As a note, you can tap preamped/processed audio OUT of the DATA IN
connection, since it is just a tap on the output of the
preamp/processor. This is also the feed into the FM modulator. But
NOTE that the front panel MIC GAIN pot doesn't adjust
the mic gain on FM - there is a separate tweaker for that.)
.KS
.SH
Serial Interface
.LP
The TS440 has a serial ASCII interface option. You have
to insert two chips into sockets on the back of the control unit circuit

board to take advantage of this. IC54 is an 8251A Uart, and IC55 is a CD4040 divider. These chips are available from Kenwood together with an interface manual, or you can buy them at your local chip shop for about $6.00 or so. When inserted, the transceiver speaks 4800 baud ascii in/out the 6-pin DIN connector ACC-1 on the rear. The signals are from the 8251, but are inverted in a 74LS04 and RFI filtered before being brought out to the world. An interface box with inverter, RFI filter, power supply, opto-isolator, RS232 level shifters, and power supply is available from Kenwood for about $49.00, or you can build your own.
.LP
Depending on how much your computer radiates and how sensitive to RF it is , you may only need +5v, +/-12v, a 74LS14, MC1488, and MC1489. If your computer has a TTL level serial port, perhaps all you'll need is the 74LS14. If you're not confident of being able to solve the possible digital/RF interference problems yourself, the $49 interface box is probably a good buy.
.LP
.TS
allbox doublebox expand center;

Adjustments
.LP
A few adjustments you should know about (read the service manual before you tweak wildly on these!):
.TS
allbox doublebox expand center;
c s
c c
n a.
.B
Some simple adjustments in the TS-440
=
.I

Tweaker What it Does
.R
RF-VR3 FM Microphone Gain
RF-VR6 FM Deviation - set to 4.6KHz on dev meter
IF-VR1 S-meter S9 - set to S9 with 40dbu input 14.175MHz USB
IF-VR2 S-meter zero - set to zero with 50 ohm dummy load
IF-VR3 S-meter FM sens - set full scale with 15.8 uv 29MHz FM
IF-VR9 CW side tone level - as you like it
IF-VR10 Beep tone level - as you like it
.TE
.KE
.LP
To calibrate your S-meter
(step numbers from the Kenwood manual):
.IP 8.
Set radio to 29.0 MHz, FM, and inject 15.8uV unmodulated signal into
the antenna jack. Adjust VR3 on the IF board until the S-meter reads full
scale (just about the width of the pointer past the 60dB mark on the
right end of the scale).
.IP 9a.
Set radio to 14.175 MHz, USB, no signal input. Adjust VR2 on the
IF board for zero reading on the S-meter.
.IP 9b.
Now inject 1.2uV unmodulated carrier into antenna input. Adjust
coil L3 on the IF board by peaking the coil and then turning
counterclockwise from the peak until the S-meter reads S-1.
.IP 9c.
Increase the input signal level to 50uV and adjust VR1 (manual says
VR3 - an error) until the S-meter reads S-9.

Self Test
.LP
Self-Test: You can run a rather complete test of the control logic by
the built-in "semi-self-test", a series of 56 routines. To run this,
turn the unit on whilst holding the AM and T\-F SET switches pushed in.
It changes to the next test when you turn the VFO knob clockwise. Turn
the power OFF to reset the unit. This does not destroy memory
contents.

Command Descriptions for Kenwood TS-440

Auto Information
AIn; The radio will send the status info automatically when
the operator changes any control covered in the IF;
command.
n = 0 for Auto Info OFF
n = 1 for Auto Info ON

See IF; for response

Display Memory
DMnnnn; This is a factory diagnostic and is of no practical
use.

nnnn = MPU address in hex

Response is:
DMnnnn-aabbccddeeffgghhiijjkk;
nnnn = MPU address in hex
aa~kk = 16 bytes of data in hex
```

Down
DN; The frequency or memory channel will go down by one
step.

Read Frequency
FA; Read VFO A.
FB; Read VFO B.

Response is:
Fxggmmmkkkhhh;
x = A or B
gg = GHz.
mmm = MHz.
kkk = KHz.
hhh = Hz.

Load VFO register
Fxggmmmkkkhhh; Loads a frequency into a VFO:
x = A or B (selects VFO)
gg = GHz. (May be 00 or spaces)
mmm = Mhz.
kkk = KHz.
hhh = Hz.

Function Select
FNn; Select VFO or memory
n = 0 for VFO A
n = 1 for VFO B
n = 2 for memory

Identify Model Request
ID; The radio will respond with:
ID001; for a TS-940
ID004; for a TS-440

The radio may respond with:
ID002; for a TS-811
ID003; for a TS-711

Read Information Request
IF; The radio will respond with:
IFggmmmkkkhhhsnnnzrxyytdfcp;
ggmmmkkkhhh is the frequency (See Fx;)
s = "+" or "-" value of RIT/XIT
nnn = value of RIT/XIT
z = "0" (I am not sure what this is)
r (see RT;)
x (see XT;)
yy = memory channel number
t = 0 for Receive
= 1 for Transmit
d (see MD;)
f (see FN;)

c (see SC;)
p (see SP;)

Lock Knob
LKn; Enable or disable manual frequency control:
n = 0 for LOCK OFF (manual control enabled)
n = 1 for LOCK ON (manual control disabled)

Memory Channel Select
MCmmm; Select a memory channel:
mmm = channel number (000 to max for radio)

Mode Select
MDn; Select mode:
n = 1 for LSB
n = 2 for USB
n = 3 for CW
n = 4 for FM
n = 5 for AM
n = 6 for FSK

Memory Read
MRnrrr; Read contents of memory channel:
n = 0 for RX VFO
n = 1 for TX VFO (split channels only)
rrr = channel number (000 to max for radio)

The radio will respond with:
MRnrrrggmmmkkkhhhdxxxxx;
n = 0 for RX VFO
n = 1 for TX VFO
rrr = channel number
ggmmmkkkhhh is freq. (See FA;)
d = mode (See MD;)
xxxxx = not used (seem to always be "0 ")

Memory Write
MWnrrrggmmmkkkhhhdxxxxx;
Write a memory. See MR; for format

RIT/XIT Clear
RC; The RIT/XIT register will be set to 0.00 KHz.

RIT/XIT Down
RD; Decrement the RIT/XIT register by 0.01

RIT/XIT Up
RU; Increment the RIT/XIT register by 0.01

RIT Enable
RTn; Enable or diable the RIT function
n = 0 for RIT OFF
n = 1 for RIT ON

```
Receive
RX; Enter receive mode.

Scan Enable
SCn; Turns scan on and off
n = 0 for Scan off
n = 1 for scan on

Transmit
TX; Enter transmit mode.

UP
UP; The frequency or memory channel will increment one step

XIT Enable/Disable
XTn; Turns XIT on and off
n = 0 for XIT off
n = 1 for XIT on

Greetings Folks,

As a proud owner of a new Kenwood TS-940 (AT), I'm especially interested in
exploring computer control possibilities of this rig. I've ordered but not yet
received the interface(s!) for it. While I'm waiting for them to arrive, I'm
consumed by several questions: I just know that SOMEWHERE there's got to be some
substantial docs for their "control syntax" (language, whatever). By substantial
I mean something more than any single page flyer that was an after thought
insert with the interface. I've already been in touch with a fellow ham who's
developing a Hypercard stack to control a 440, similar but not identical command set, or so
I am told. I
<think> the 440 commands are a subset of the 940's.

Has anyone else been successful in figuring out / programming the "command
language" / syntax (whatever!) for the 940? I've tried Kenwood once so far, but
```

alas, I'm awaiting a call back... soon I hope! Do you know who can help, or the name (Kenwoodeese!) of the documentation that defines the command language, etc. I'm especially curious in just HOW MUCH control Kenwood gives you... power on/off, memory operation and storage, etc (full front panel - more or less :-) ?); or just the primary stuff - band /freq changes, UP/DOWN, etc.? Anyhow, thanks again for your response and I'll be in touch.

I know in so many hobbies there are "specialized" clubs / SIGs, etc. Anybody know of any group involved in 940 pursuits?

Hope to catch you on the air soon.

73 de Pete, N5KBD

While I'm at it, does anyone know of any Oklahoma HF nets - transplanted to New Jersey, but my heart's in Coweta (for you non-5-landers, that's about 25 miles SE of Tulsa)!

Your attitude fascinates me. Tell me, just what is the basis of your intense interest in safegurding access to radio transmitting equipment by people who can't lawfully use it? Sounds a bit odd to me.

I am not sure whether this posting is serious or not.

But microwave ovens operate at 2450 mhz (I didn't think anyone
operated any other services there). They generate a ragged spectral
peak modulated by both 60hz (they usually don't use much of any filtering
on the power to the magnetron) and the energy dispersing stirrer which
typically sweeps the signal up and down 5-10 mhz at a few hertz rate as
the phase of the rf reflected back to the tube changes and pulls
the oscillation frequency up and down.

Even though the leakage from a operating oven is supposed to
be pretty small, with a decent spectrum analyzer and a 20 db gain horn one can
usually find several microwave oven signals going at one time from a built up
area such as a city rooftop.

Mark Bitterlich writes:

Mike, if the SPEED LIMIT was 25 MPH and I sprinted down the sidewalk on
foot at 26 MPH, you'd probably give me a ticket wouldn't you?

}I do know of a cyclist ticketed for doing 35 mph in a 25mph zone, I see no
}reason a runner couldn't be. Believe it or not sometimes laws really do
}mean just what they say.

The reason a runner can't get a ticket is because the speed limit as written
applies to vehicles. And while a bicycle may be classified as a vehicle, a
person running on foot can not. This was why I used it as an example to the
music question. It is all a matter on how you read or how you interpret the
rule. And Mike, laws can very easily be misinterpreted, you just fell
victim to a good example.

I simply said that a BINARY FILE is not
music, that a FAX is not music, and RADIO TELETYPE is not music.

}Interesting theory, how do you classify a digital CD? It is after all just
}a binary file.

That is correct, and has been my point all along. If someone transmitted
the contents of the CD in its pure digital format, it should not be
considered to be the same thing as if he first ran it through a CD PLAYER
and transmitted the actual music that resulted from that. I think that it
is fair to say that transmitting digital data is different from transmitting
real time music. That is my opinion.

(stuff deleted)

}Yes true, I'm just as happy to watch you take all the risks for what I see
}as absolutely no gain.

I am only taking risks if your opinion happens to be right. You have no
examples of anyone ever being prosecuted for violating the law as you are
interpreting it, and I happen to think that you are all wet. It's just that
simple. As to what there is to gain.... well I happen to think that the
technology that allows us to do something like this is very exciting and
offers "gain" all unto itself. I am not talking simply of packet radio or
fax but of the communication of data that results in third party reaction
from COMPUTERS at either end. To me... that's a significant "gain".

Before this goes much further, let me try to bring home the real reason that I wrote all of what I did on this issue. I have seen a "trend" where there appears to be a group of people that at times try to "interpret" amateur radio regulations to suit their own means. I think we all have been guilty of this at some time or another and the specific reasons as to why are not at all important at this time. Interpretations of the law can come in three forms, those that "nit-pick",those that look for "loopholes", and those that try to understand the "intent" of the law and follow that.

I find it interesting to read how different people view the same written words and come up with different meanings. It can result in a broader outlook on communication in general. HOWEVER...when someone states an opinion and then comes across as if reading from the book of Jove.... i.e. THIS IS THE WAY IT IS, IF YOU IGNORE ME YOU ARE RISKING HAVING YOUR AMATEUR LICENSE R E V O K E D !!! Well... I get kind of upset. These people are no more qualified than anyone else to make such judgment calls and this is the whole reason why I wrote what I did.

I believe that the INTENT of the music regulation was to keep hams from becoming DISK JOCKEYS of local radio stations. Interestingly enough there is a ham (or group of hams) that has managed to do just that... they just don't play music. (I think it's called the IARN??) In any case, I do not think that the intent of the law was to prohibit hams from transmitting a fax that had printed musical SYMBOLS on it (or transmitting digital files, or digital CDs etc., etc.)

You can tell me that you disagree with me but please don't tell me that I am WRONG and that I am "taking risks". The only thing to be gained from statements like that are arguments that can never be resolved.

In the meantime I will continue to transmit my "Play Bach" files and if anyone hears of the FCC violating anyone for transmitting digital files that reconstruct music on a computer, please post to: :-)

2515. More on NightWatch VIP UHF-Mux air/ground circuits

Newsgroup: rec.ham-radio
Date: 1989-09-08 08:12:58 UTC
From: die@cpoint.UUCP
Message-ID: <2586@cpoint.UUCP>
Source record: 17080
Cross-posted to: rec.ham-radio,sci.electronics

Some more information on the UHF FM-FDM-SSB system used to link the
flying command post aircraft and ground communications facilities follows.
This system is also used to provide full duplex telephone grade voice circuits
for the VIP aircraft such as Air Force One.

The airborne radio equipment (made by ECI), transmits
a 1kw (or two selectable lower powers) signal to blade antennas on the
aircraft which are more or less omnidirectional. The ground sites use
a phased array of four UHF broadband traveling wave antennas arranged in a
square to give some gain and jamming rejection. The signals are vertically
polarized.

The modulation is FM-FDM-SSB with up to 14 voice channels and
a baseband order wire. Unlike most FDM systems, the channels are
paired with a lower sideband 4 khz voice channel sharing a carrier
frequency with an upper sideband voice channel immediately above it.
The carrier frequencies are used are 8, 16, 24, 32, 40, 48 and 56 khz.
A 0 TLP tone on a channel is supposed to deviate the transmitter about
30 some odd khz (although the actual level on real signals appears to be less
than this).

The aircraft and ground multiplex equipment use the old fashioned
2600 hz sf signalling for supervision, this means that idle channels carry
a -17 db TLP 2600 hz tone which drops when the channel is seized. Dialing
is DTMF using the Autovon standard phone tones. Since the circuits terminate
in Autovon switches, they are fully four wire.

The aircraft transmits a 120 khz pilot tone, ground sites use
a lower frequency pilot.

There is considerable provision for air to air relay of communications
and use of relay aircraft is an organic part of the system design. Many
of the command post aircraft are equiped to relay several links at once
and relay operation is quite often tested both to communicate with
other command post aircraft and with VIP aircraft such as Air Force One.
The relay aircraft (particularly the command post aircraft) have manual
switchboards that allow selected channels from an incoming signal to be cross
connected to different channels on one or more outgoing signals. VIP
communications circuits are thus often routed on certain channels of
command post links that carry military traffic on other channels.

The frequency from 0-4 khz on the signals is used for a orderwire.
The radio equipment has appropriate provisions for conference bridging
on this circuit so the order wire at any point has most all of the
stations on it. [The order wire on this system has been code named

ADVENT for at least twenty years.] The order wire is used to coordinate circuit switchover between ground stations and/or relay aircraft and to coordinate circuit test and maintainence.

There are a number of Ground Entry Point sites scattered throughout the US used with this system, most seem to be at hardened blast resistant AT&T microwave sites with deep underground bunkers on springs. These sites are probably used because they represent points where hardened underground cables connect to each other and radio systems. The ground entry sites can be recognized by the distinctive square pattern formed by 4 vertical pole antennas (quite long and thick, unlike most UHF antennas) on top of an AT&T microwave tower (above the microwave horns) spaced about 8-12 feet apart. A random sample of sites I am aware of includes Green Hill Rhode Island, Waldorf Md, Hillsboro Mo, and Pensuco Florida. There are several more.

Maximum range from an aircraft to a ground site is typically 210-230 miles depending on altitude, air to air range is closer to 400 miles. With powers of 1 kw or more EIRP, the signals are very strong on the ground when the aircraft is closer. The high power is supposed to be intended to ensure that communications can penatrate nuclear fireballs and other propagation disruptions during a nuclear attack.

The system is used to carry clear voice traffic (including traffic from Air Force One), and also various forms of digital transmission of a sort that fits in a 4 khz voice channel. This includes slow speed 75 baud clear and encrypted tty, 1200/2400 baud data, and full duplex 9600 baud data, fax and secure voice.

The VIP aircraft using the system use only 4 Autovon circuits per signal and only use 16 and 24 khz channels from the aircraft (but the ground sites transmit a signal with sf tones or traffic on all the upper 12 channels). The command post aircraft usually use all 14 channels.

The system has been in use since about 1965, and as such it is very old technology. Much of the information in this article is based on material published 20 years ago that I dug up as a college age hacker in that era. The signals still seem to be on the air however. I understand that Milstar and other sophisticated, secure systems will substantially replace these aging links in the near future, both for Air Force One telephone traffic and nuclear post attack communications, so there can be little about this subject that is truly inappropriate to discuss.

For those curious to look at the signals, the current VIP frequencies are :
Aircaft Ground
RF Channel 1 382.35 mhz 326.00 mhz
RF Channel 2 305.55 mhz 246.95 mhz
RF Channel 3 336.80 mhz 344.00 mhz
RF Channel 4 * 322.75 mhz 366.00 mhz
RF Channel 5 397.05 mhz 390.00 mhz

* Air Force One most often uses RF-4.

> The only thing I've heard of is Monitoring Times - are there any opinions
> about it, and where are they?

Scanner club: Scanner enthusiasts are invited to join
the RCMA (Radio Communications Monitoring Ass'n), the
world's largest scanner club. Founded in 1975, the RCMA
prides itself on being the "first national and interna-
tional organization of monitor radio listeners," and is
not affiliated with any manufacturer or business
interest. RCMA members receive a monthly newsletter of
about 95 pages. Although the focus is on VHF and UHF
ranges, there is coverage of HF utility stations below 30
MHz, and "no holds barred" equipment reviews.

There are several regional RCMA chapters, including the
Chicago area chapter, which holds regular meetings. 1989
Chicago chapter meetings will be held Saturdays. For the
time and location of the next Chicago area chapter meet-
ing, contact: John Arendt, 327 Boulder Hill Pass,
Oswego, IL 60543. tel. (312)554-3156.

Write for RCMA membership information to: RCMA General
Manager, P.O. Box 542, Silverado, CA 92676.

I belong to RCMA and the All Ohio Scanner Club (AOSC), and
subscribe to Monitoring Times and Popular Communications.
Monitoring Times is a good magazine, although their scanner
coverage is not as good as it used to be. You can subscribe
to MT from Grove Enterprises, PO Box 98, Brasstown, NC.
Grove used to offer a free sample issue.

Popular Communications is sensationalistic and IMHO -- trashy.

>
>
Your response fascinates me. In what way do you mean "odd"? My call is
at the end of the note, if you'd like to look me up.

My interest is two-fold. First, the law allows ownership of
transmitters. (What is not forbidden is allowed -- one of the most
important legal concepts in freedom.) So the reason for purchasing a
transmitter is left to the individual. Some such as myself and others
who have responded bought them because we were studying for our
licenses. Some might buy them for other reasons that are their own and
nobody else's business. Owning a transmitter does not imply sinister
purpose.

Second, why should I or anyone else have to seek out and snuggle up to
some stranger to get them to order gear that I am allowed to purchase
myself? Especially if it's just on the specious reasoning of some
self-important jerk who thinks he has the right to look over my
shoulder? The contempt implied in the "it's no real burden on you to go
through several levels of indirection to satisfy my personal whim"
approach is incredible.

I am working on an automated logging program (Yes, yet another one).
I currently have the interface for Kenwood up and running, and would like
to support ICOM and YAESU as well, but do not have the necessary documentation
to do so.

If anyone can supply me with a copy of the communications protocol for these
rigs (I would be glad to supply postage and copying costs), I will supply
a copy of the logging program in return. It is designed to run on a
PC compatible computer.

Thanks in advance,
Alan Yorinks WB2OPA

FLAMES! FLAMES! FLAMES! Deteat the snobs!

From article <30500180@ux1.cso.uiuc.edu>, by phil@ux1.cso.uiuc.edu:
>
> The "conspiricy" part of it is not specifically illegal. Boycott's are
> typically an expression under the 1st amendment.

So... Maybe you appreciate the rights of others?

> Also, I do not see it preventing the lawful ownership and use of radio gear
> by non-hams in the case of candidate hams, as they can still get it via a
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
do they have to prove it to you, or just to the dealer?
> ham, and can contact the ARRL to find a ham. Dealers who follow my principle
^^^^^^^^^^^^^^^^^^^^^^^^
let's hope businessmen have more of common sense
> can also give suggests, and they probably have a database of hams that have
> purchased from them anyway.
^^^^^^^^^^^^^^^^^^^

Why some snobs are so much against the right of other people (who didn't
have the luck yet to wear the same sheepskin as you) to own something?
Come on, it's not from your pocket. Oh, sorry, I forgot - you're
defending the IDEA...

> The ham-candidate trying to buy a radio from a dealer can get a referral
> from the dealer to a local ham, so I see no major problems.

Very stupid. What if there's NO local ham? What if I don't want to deal
with particularly that local one? And why the hell should I?!

> Sale of legitimate CB's and 49 Mhz stuff would not be affected since anyone
> can legally use them.

Thank you very much! You're soooo kind...
BTW, can you own a gun? Can you legally use it? What about
Commando knife?

>> I am still thankful that it has no future beyond pointless network
>> wrangling (like this) and the comically eccentric behavior
>> on the part of people who try to get radio stores to go along with it.
>
> Definitely NOT pointless, comical or eccentric, as your "straw man" posting
> tries to give the impression. I am very serious about this and intend to
> work on making it happen.

Let's hope there's not enough of such agressive "straw head"... oops,
"straw men" to make it really serious. And if you have nothing else
to do - well, it's your time. You may waste it in any way suitable
for you (yup, even without asking my permission. And _I_ don't care
what you'll buy and where from, and how thick the bunch of papers is
you're going to present to prove that YES, YOU DO HAVE A RIGHT TO OWN
THAT THING).

FLAME OFF.

Uri.

}The author, Robert
}Corn-Revere, even points out that an UHF TV tuner can pick up cellular calls.
}I didn't know that.

The top of the UHF TV band is 800 mhz, almost all US tuners have that much extra range. You do have preoblems identifying which channel is which and sorting out several calls. The sensitivity is awful by communications

I have heard (but not verified) that the IF from the tuner is around 49 MHZ and can be piped into a scanner. The scanner can be used to tune the individual channels and is narrow enough to tune individual channnles. Of course the numbers on the display will be the IF freqs and not the actual frequencies....

The basis could be that THE RIGHT TO OWN SOMETHING and THE RIGHT
TO USE SOMETHING are DIFFERENT! Doesn't everybody understand it?

Can you drive your car legally above <your speed limit - something
like 55mph>? If no - maybe you can't own it, since it's capable of
running with that speed?

And sometimes people just want to own something they either can't
use right away, or can't use at all. It's THEIR business, anyway.
Why should anybody else meddle into it? MYWB!

Regards,
Uri.

2525. PRO 2005 Thoughts and Queries

Newsgroup: rec.ham-radio
Date: 1989-09-08 19:52:09 UTC
From: flash@lopez.UUCP
Message-ID: <768@lopez.UUCP>
Source record: 17095
Cross-posted to: sci.electronics,rec.ham-radio

A couple weeks ago I purchased the Radio Shack Pro 2005 scanner. Thus far I am quite pleased with the unit. Using only my 3/4 wave 2 Meter ground plane, I have picked up stations all over creation. Even some FMBCB DX from about 450 miles away (the audio quality on WFM surprised me, the set could be used as a mono hifi tuner)

I would like to hear from others who have this scanner, to share tips and so forth...

Has anyone tried connecting the 2005 to the 70 MHz output of a satellite dish, and using it as a SCPC receiver? This should be possible. I am contemplating adding a dish soon, and AUDIO is my prime interest. If you have not tried it, how about someone with the requisite setup giving it a shot, and tuning to a satellite with known SCPC transmissions (I think WESTAR 4 has a bunch) and passing along their findings.

WHAT ABOUT FLTSATCOM?

On what frequencies can one find satellite transmissions with clear voice?

I remember reading an article a few years back that one could pick up military satellite transmissions from the geostationary FLTSATCOM. Is this

still the case, or have emissions modes changed?

I have been enjoying listening to the 200-400 military band. Lots of transmissions on the SAC channels (I am near K.I. Sawyer AFB)... This alone makes the scanner worth the money.

I have not clipped any diodes yet, since there is precious little in the 800 mhz region here in the hinterlands. Federal Express is up there, and so far they have the entire range to themselves.

Any recommendations regarding organizations or newsletters that could increase one's enjoyment of the wide spectrum the 2005 can receive? I already get POPCOM and MONITORING TIMES... What about SCMA? Do they have things besides giving specific frequencies and ten codes for cities I will never visit?

KEEP SCANNING!

From: jimv@hienergy.East.Sun.COM
Message-ID: <810@east.East.Sun.COM>
Source record: 17105

While looking through a new Service Merchandise catalog (national catalog order/showroom company) I was surprised to find the Uniden HR 2510 10 meter mobile in with the CB's and radar detectors. The description was sparse and no mention was made about requiring a license for operation. I wonder how many folks will order it thinking it's just a 25 watt CB? I plan to write them and voice my concerns. I don't have the address handy, somewhere in NC I think. I'll be glad to post it if others are interested.

2529. WAR on 14313

Newsgroup: rec.ham-radio
Date: 1989-09-08 22:38:11 UTC
From: flash@lopez.UUCP
Message-ID: <769@lopez.UUCP>
Source record: 17100

I note that this group does not get into too much ham radio politics (other than perhaps the PIZZA/AUTOPATCH thread), but I think perhaps the situation taking place on 14313.0 deserves some discussion.

Indeed, one can not tune the 20 meter band without hearing some discussion of the RADIO WAR that is presently transpiring on this frequency. 313 has always had its share of hecklers, QRM'ers etc, but the situation is now totally out of hand.

The Maritime Mobile Net, and the Intercontinental net have, indeed, vacated the frequency, and are now on 14316. 313 is now being held from bandopen to bandclose by a group called the "BETTER AMATEUR RADIO FEDERATION (BARF) group, whose stated purpose is an INFORMATION NET. They maintain that the other two nets are in violation of the new FCC rules (which are really just the OLD rules if one would bother reading them)... And that the two nets exist only for Toll Fraud. (Avoiding the phone company by setting up phone patches).

The two nets in question have been in operation at least 20 years, under very similar FCC rules regarding phone patches, yet the Barf Boys claim that under the NEW rules, ALL PHONE PATCHES are ILLEGAL. (since they bypass TELCO, and thus provide a financial benefit, which is not Kosher)...

Now, I have to admit it, I LOVE A GOOD RADIO WAR. No regular user of 3950 (my home frequency) gets upset by a good radio duel, but as I listen today, I hear STEAM TRAINS, Whistles, Funny voices, Bogus CW, RTTY and VILE QRM. K4MUJ and W5FX, the two main BARF NCS stations claim that all this QRM is from members of the two nets that used to be on the frequency. Apparently, the BARF boys get up early and stay late, establishing "frequency rights".

Glen Baxter, K1MAN was involved briefly in the mele, but has since gone back to the operation of his own IARN, and dropped his 14313 net activities.

So what does it all mean?

Will the QRM'ers be apprehended? Will the FCC require us to gut our phone patches and make them into kitty litter pans? Will we get ANOTHER set of rules? Will HF ham frequencies be deeded over to the SWBC stations? Will the BARFers get bored, and will the other two nets return to 313?

OPINIONS? THOUGHTS? PREDICTIONS

At least 313 is providing some interesting listening of late.

2531. For other owners of the Sony ICF-2010

Newsgroup: rec.ham-radio
Date: 1989-09-08 23:58:48 UTC
From: robert@arizona.edu
Message-ID: <13874@megaron.arizona.edu>
Source record: 17102

I just bought a new Sony ICF-2010. After spending about an hour with it and the manual I was satisfied with its basic ergonomics and features. But I really spent that amount of money for the reported fade resistance of its sync feature and I am not at all satisfied with that.

So, other owners of 2010's, here is what I do: I find the station, let's say 9690 kz. I make certain that I have "sync" turned on and "tune mode" set to slow. When I am tuned to the nominal frequency the lower sync light comes on. Going up 0.1 kz turns on the upper sync light. OK, so far.

Now if I have the radio set to exactly 9690, within about 5 - 10 seconds I start getting the growling sounds. But if I have the radio set to 9690.1, then the upper sync light is on and everything is OK. There are times though when the lower sideband sounds better than the upper, but I can't use it since the set invariably starts growling!

One other factor. If I select the narrow bandwidth, it will usually be stable, but I don't always want the narrow filter. Why have a selectable filter if you can only get the sync feature to work with one setting?

Do other owners have the same problem? This new machine doesn't seem to solve the fade problem any more than my little $80 Radio Shack portable. Did I just get a lemon, or is all the hype I've heard pure hype? Philips and Sangean sell sets for $200 less with performance not much different.

Note that I am not trying to do any DXing. My wife and I are regular SW listeners who are interested in the contents of the broadcasts and were trying to find something that would be more pleasant - less fading and whistling. I would like people who actually own one of these and use it regularly to respond, please.

Yours disappointedly,

QSL INFORMATION.

FY7DG, CHRIS, ASKS FOR HIS CARDS TO BE SENT TO BOX 450 KOROU,
FRENCH GUYANA.

5Z4BH WILL QSL VIA KE3A.

EL2E WILL QSL VIA HB9STZ.

FK8BG INDICATES THAT HE WILL QSL VIA F6EWK.

YJ8GP IS REPORTED TO QSL VIA BOX 665, PORT VILA, REPUBLIC OF VANUATU.

ZK1CT COLLECTS HIS CARDS VIA MAUKE HOSPITAL, MAUKE, COOK ISLANDS VIA NEW ZEALAND.

J52US REPORTS THAT HIS QSL MANAGER IS WA8LOC.

NOTES OF INTEREST.

VE3JPC REPORTS THAT HIS TRIP TO SENEGAL AND GAMBIA IS DELAYED. HE IS NT SURE FOR HOW LONG. IT IS NOT A QUESTION OF IF, BUT WHEN. WE WILL LET YOU KNOW WHEN DETAILS ARE FINALIZED.

Z21FB RUNS A MAIL SCHEDULE WITH SOME NEW YORK OPERATORS AT 1200Z ON 14067 KHZ ARQ. YOU COULD POSSIBLY CONTACT HIM AFTER HIS SKED.

ROD, 5Z4BH, INDICATES THAT HE WILL BE QRV FROM 9X5AA FOR THE CQ WW RTTY CONTEST. ROD ALSO STATES THAT HE WILL BE GOING TO ET, 5R AND 5H BUT NO DATES HAVE BEEN SUGGESTED AS YET. THERE SEEMS TO BE SOE CONFUSION IF HIS MONITOR IS WORKING OR NOT. SOME SAY THAT ALL IS WELL, OTHERS SAY THAT HIS MONITOR IS NOT WORKING, AND THEREFORE HE CANNOT OPERATE RTTY. JUST KEEP WISHING. THERE IS ALSO THE STORY THAT HE MAY BE GOING TO T5CT AFTER THE CQWW CONTEST. KEEP LISTENING FOR FURTHER INTERESTING STORIES.

THERE IS STILL THE RUMOR THAT THERE WILL BE ACTIVITY FROM 5A EARLY THIS MONTH.
GL DE DX1.

2535. Bandwidth/filtering of wideband digital.

Newsgroup: rec.ham-radio
Date: 1989-09-09 03:24:05 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <8909090324.AA25095@cmr.ncsl.nist.gov>
Source record: 17113

Phil Karn writes:
] I don't know why everyone is so concerned about QRM from wideband digital
] links. Take a look at the spectrum analyzer photos on page 74 of the 6th
] ARRL Computer Network Conference proceedings. The WA4DSY modem's spectral
] density in a 3 KHz sampling bandwidth is down 30 dB from its mid-band level
] at about +/-50 KHz, down 40 dB at +/-60 KHz, and down 50 dB at +/-90 Khz. At
] about +/- 120 KHz, it hits the noise floor of the spectrum analyzer, 60 dB
] below the mid band level.

Sorry, Phil, but I don't have the "proceedings" in question, however, the numbers you quote don't sound like a wideband signal to me. ie: I would like to see a few hundred kilobits per second before I thought about "wideband". Also, a spectrum analyzer does not a good EME (or tropo) receiver make.

Suppose that we are talking about a typical "serious" weak signal 902 MHz receiver with a noise figure of 1 dB, or a power of about -170 dBW in your 3 kHz bandwidth. Free-space attenuation of 10 km at 900 MHz is about 112 dB. Given a digital station transmitter power of +10 dBW, and no net antenna gain (due to mispointing - I'm being REALLY generous on this one, the situation could be 40 dB worse with beams pointed at each other), the digital carrier will be about -100 dBW at the weak-signal receiver.

How far from the digital signal's center frequency is the power down 70 dB or 80, 90, 100, 110 dB (stated in terms of fundamental baud rate)?

Whatever the answer, it gives some idea of the frequency spacing/filtering we need to be good neighbors to our fellow hams.

Constructively, Bob, W3OTC

2536. Transmitting Music for ATV

* Phil howard-- <phil@ux1.cso.uiuc.edu> writes:
Mark Bitterlich <mgb@apg-tecnet.apg.army.mil> writes:

[stuff omitted]

*Don't get so uptight. I was telling people about how the FCC wrote the
*rules, and was not passing judgement on what can or cannot be sent over
*the air.

Fair enough. I've received a lot of personal mail on this subject Phil
some pro.... some con. Actually I read postings from you all the time
and find them interesting and informative. However I took strong exception
to this one since I felt it was a little overbearing. That was not your
intent although as you can see Mike jumped in to defend it as if it WAS
a "ruling" so to speak, so maybe you can understand how it was taken.

*Digital input files for music playing programs is a form of music just as
*much as an analog waveform of the sonic vibrations is.

The digital input file is a component that is necessary for the final
product. The analog waveform IS the final product. It is illegal to
possess the drugs called "Speed" and "LSD" but it is not illegal to own
the chemicals that are used to make the drugs.

*The FCC did NOT say "musical sounds". They said "music". SHEET MUSIC, and
*ACOUSTIC MUSIC, and any other form of music falls under the general category
*of MUSIC.... and the FCC says "NO MUSIC".

And the sign said "No Smoking" but that doesn't mean you can't light a match.

When you write a law, there is no way to include provisions for situations
that have yet to be invented. I believe that was the case with this reg.
How would you suggest that we get the true answer to this question?
Or would the question best be left unasked? And this brings about an
interesting point.... what is the best way to get TRUE answers on issues
like this? (Other than our own personal opinions) ... And WITHOUT calling
the FCC!!!!

[lots of stuff deleted]

*OK. We both are entitled to opinions. We both are entitled to follow
*our opinions. We both are entitled to express our opinions to others
*willing to listen.

[big stuff deleted]

*These are my own opinions, damnit, and if you can't figure that out, then
*just put my name in your kill file and quit sweating over it.

I put these above two paragraphs together so I could ask you which one you want me to follow. The top or the bottom? :-) I am not "sweating it" as you put it, I was taking strong exception to an outlook on rule interpretation that worries me (sincerely). I do not really understand WHY you posted the article in the first place other than to express the way that you thought all amateur operators should interpret a rule that is taught to us all at the novice level. I think that I offered a way of viewing that rule that is shared by the majority of hams on the air today.

Why try to look at a regulation with an eye towards prohibiting something that has just started to be experimented with? Examples of issues like this came up with reverse autopatches, packet radio (do we or do we not have to be present as control operators for "digipeaters") and now transmission of digital files that contain music. It even came up in reference to modem design when digital encryption was used to "smooth" the signal on a 56 kbs system. I believe that interpretations that tend to limit or prohibit experimentation in new areas are counterproductive to us all as ham radio experimenters and operators.

If a rule is going to be "pushed" in one direction or another, I suggest that it be pushed to the side that allows new ideas and methods to be tried and perfected and not to the side that restricts us before we even get going, especially when there are no precedents to indicate otherwise.

Is that a "radical" point of view? (I'm asking, not telling)

In article <8909080514.AA17797@apg-tecnet.apg.army.mil> mgb@APG-TECNET.APG.ARMY.MIL writes:
}}*swrinde!cs.utexas.edu!oakhill!dover!darla!waters@ucsd.edu (Strawberry Jammer)
}}*Mike Waters writes:
}mgb@apg-tecnet.apg.army.mil
}Mark Bitterlich writes:
}
}Mike, if the SPEED LIMIT was 25 MPH and I sprinted down the sidewalk on
}foot at 26 MPH, you'd probably give me a ticket wouldn't you?
}
}}I do know of a cyclist ticketed for doing 35 mph in a 25mph zone, I see no
}}reason a runner couldn't be. Believe it or not sometimes laws really do
}}mean just what they say.
}
}The reason a runner can't get a ticket is because the speed limit as written
}applies to vehicles. And while a bicycle may be classified as a vehicle, a
}person running on foot can not. This was why I used it as an example to the
}music question. It is all a matter on how you read or how you interpret the
}rule. And Mike, laws can very easily be misinterpreted, you just fell
}victim to a good example.

Ah but you didn't say VEHICLE speed limit, boats and airplanes commonly
have speed limits. I have never heard of one for runners, but its certainly
not impossible.

}I simply said that a BINARY FILE is not
}music, that a FAX is not music, and RADIO TELETYPE is not music.
}
}}Interesting theory, how do you classify a digital CD? It is after all just
}}a binary file.
}
}That is correct, and has been my point all along. If someone transmitted
}the contents of the CD in its pure digital format, it should not be
}considered to be the same thing as if he first ran it through a CD PLAYER
}and transmitted the actual music that resulted from that. I think that it
}is fair to say that transmitting digital data is different from transmitting
}real time music. That is my opinion.

I will have to tell the local music stores that they really aren't selling
music on CDs. NOTHING anywhere is said about the form of the music you
notice.

}}Yes true, I'm just as happy to watch you take all the risks for what I see
}}as absolutely no gain.
}

}I am only taking risks if your opinion happens to be right. You have no
}examples of anyone ever being prosecuted for violating the law as you are
}interpreting it, and I happen to think that you are all wet. It's just that
}simple. As to what there is to gain.... well I happen to think that the
}technology that allows us to do something like this is very exciting and
}offers "gain" all unto itself. I am not talking simply of packet radio or
}fax but of the communication of data that results in third party reaction
}from COMPUTERS at either end. To me... that's a significant "gain".

}Before this goes much further, let me try to bring home the real reason
}that I wrote all of what I did on this issue. I have seen a "trend" where
}there appears to be a group of people that at times try to "interpret"
}amateur radio regulations to suit their own means. I think we all have
}been guilty of this at some time or another and the specific reasons as to
}why are not at all important at this time. Interpretations of the law can
}come in three forms, those that "nit-pick",those that look for "loopholes",
}and those that try to understand the "intent" of the law and follow that.

I find it interesting that you ASKED for people's opinions then flamed them
when you didn't get the answer you liked. Sounds like the games played on
CB all the time.i

}I find it interesting to read how different people view the same written
}words and come up with different meanings. It can result in a broader
}outlook on communication in general. HOWEVER...when someone states an
}opinion and then comes across as if reading from the book of Jove....
}i.e. THIS IS THE WAY IT IS, IF YOU IGNORE ME YOU ARE RISKING HAVING YOUR
}AMATEUR LICENSE R E V O K E D !!! Well... I get kind of upset. These
}people are no more qualified than anyone else to make such judgment calls
}and this is the whole reason why I wrote what I did.

Again WHY ASK if you only wanted your own opinion?

I don't claim "book of Jove", except that you forget that the FCC is first
and foremost a beuracracy and a beuracracy MUST live by the stated rules
and not the intent. It happens that the FCC has been extremly accomodating
for the Amateur service, in that if the letter of the rules don't allow
something then they will grant an STA (Special Temporary Authorization) if
you can show a good reason to do something not in the rules. Packet Radio
on HF (and I think some VHF) operated this way for some time. So did the
earliest repeaters.

There is a vast difference between saying "I have something I want to do
that is within the intent of Amateur Radio how can I do it" and saying "I
don't know anyone who has been prosecuted (yet). I will just defy the
stupid FCC and do it anyway.
Boy will I wail when I have to pay for it though."

Seems to me that you are tending towards the latter.

I am reminded of all the "reasons" why various CBers wouldn't be caught
with their linears. Many of them get quite exhaustive and quite reasonable
arguments too. Too bad the FCC says 5 watts means 5 watts and NO

exceptions.

}I believe that the INTENT of the music regulation was to keep hams from
}becoming DISK JOCKEYS of local radio stations. Interestingly enough there
}is a ham (or group of hams) that has managed to do just that... they just
}don't play music. (I think it's called the IARN??) In any case, I do not
}think that the intent of the law was to prohibit hams from transmitting
}a fax that had printed musical SYMBOLS on it (or transmitting digital
}files, or digital CDs etc., etc.)
}
}You can tell me that you disagree with me but please don't tell me that
}I am WRONG and that I am "taking risks". The only thing to be gained from
}statements like that are arguments that can never be resolved.
}
}In the meantime I will continue to transmit my "Play Bach" files and if
}anyone hears of the FCC violating anyone for transmitting digital files
}that reconstruct music on a computer, please post to: :-)

The regulation STILL says "the transmission of music is STRICTLY
forbidden". Nothing there about only analog forms. Just "forbidden". Tell
me what there is to interpret?

BTW I think you CAN argue that a FAX or a program to play music is the
instructions for the music and not the music.

In any event:
Please don't transmit them over MY repeater or any of the links I am
responsible for in ANY form whatsoever. That is in my power, the rest is up
to the FCC if they care to do anything. Just remember who carries the
bigger stick :-)

You can play power games with the FCC if you like, I chose not to.

The ECPA is the kind of law that could really cause problems later, it's
almost a bobby-trap.

If they say it's not going to be enforced then we should get rid of it!
I don't like laws that say what I can't listen to!
and all this because the celluar marketeers didn't want to spend a few bucks
on [even simple] encryption!

I tell ya if people listened to (and knew how to listen to) cells they could
end up being very mad at their spouses! oh that's right they can Use any of the
info they get that way...

Another case of keeping the Honest people Honest... another useless law...

A few days ago I asked for help in finding a ham-radio organization in Connecticut. Well, I want to thank everyone who replied to my message. Unfortunately, I received so many messages telling me about the ARRL that if I were to write personally to each person, I would never have time to get my license! I'm sure you'll be hearing from me on this bulletin board in the future, since I plan to have my license and be broadcasting as soon as possible. So, thank you again, and I'll soon be talking to you both here and on the radio.

Valerie (VNOZICK@EAGLE.WESLEYAN.EDU)

hP>had an IC22S and did some modifications on the programming section of
hP>the synthesizer.

If you are referring to adding a set of BCD switches to one of the
diode matrix positions which would enable you to manually switch
frequencies in 15Khz increments then this has been covered in various
magazines such as CQ and 73.

You will have to scan through a few years of magazines but it's there
somewhere.

I am not aware of any direct synthesizer mods though.

*Seems to me that you are tending towards the latter.

Mike this is the attitude that first got me going so badly. Why is it that if I disagree with you and your interpretation of the regulations that I am "DEFYING THE STUPID FCC"? I am trying to be civil here and not to throw stones at you, but doesn't it sound just the least bit funny that you refuse to admit that you could be wrong, and accuse those that disagree with you of being lawbreakers and related to CB'ers? I ADMIT that I could be wrong, I do not THINK that I am, but nobody is perfect. Are you?

*I am reminded of all the "reasons" why various CB'ers wouldn't be caught
*with their linears. Many of them get quite exhaustive and quite reasonable

*arguments too. Too bad the FCC says 5 watts means 5 watts and NO

You must really be mad at me, that's about 3 or 4 times that I am being likened to a CB radio operator by inference to my beliefs. Thanks Mike.

*BTW I think you CAN argue that a FAX or a program to play music is the
*instructions for the music and not the music.

Ok, sounds good to me. I thought I was trying to say that, but I guess that I can not write well enough to express my thoughts. Sorry. Your statement was what I was trying to say. Thanks.

*Please don't transmit them over MY repeater or any of the links I am
*responsible for in ANY form whatsoever. That is in my power, the rest is up
*to the FCC if they care to do anything. Just remember who carries the
*bigger stick :-)
*You can play power games with the FCC if you like, I chose not to.

As far as packet radio goes, I thought that the regs now said that you were not responsible for what was relayed through the links (on VHF) and that was why they could be operated in an unattended mode. Again I thought that the originator of the traffic/data was the one responsible. And Mike, I own and operate a few "links" myself, but I avoid the temptation to play radio cop and try to allow the maximum flexibility to those that are experimenting with new things. A difference in how you look at it I guess. Don't worry though, I'll be careful to avoid your systems... I haven't yet quite figured out HOW I can do this, but I'll try.. Ok?

Are we having fun yet?

Source record: 17120

*mailrus!sharkey!lopez!flash@tut.cis.ohio-state.edu (Gary Bourgois) writes:

[stuff omitted]

*The Maritime Mobile Net, and the Intercontinental net have, indeed, vacated
*the frequency, and are now on 14316. 313 is now being held from bandopen
*to bandclose by a group called the "BETTER AMATEUR RADIO FEDERATION (BARF)
*group, whose stated purpose is an INFORMATION NET. They maintain that the
*other two nets are in violation of the new FCC rules (which are really just
*the OLD rules if one would bother reading them)... And that the two nets
*exist only for Toll Fraud. (Avoiding the phone company by setting up phone
*patches).

*The two nets in question have been in operation at least 20 years, under
*very similar FCC rules regarding phone patches, yet the Barf Boys claim
*that under the NEW rules, ALL PHONE PATCHES are ILLEGAL. (since they bypass
*TELCO, and thus provide a financial benefit, which is not Kosher)...

*Now, I have to admit it, I LOVE A GOOD RADIO WAR. No regular user of 3950
*(my home frequency) gets upset by a good radio duel, but as I listen today,
*I hear STEAM TRAINS, Whistles, Funny voices, Bogus CW, RTTY and VILE QRM.
*K4MUJ and W5FX, the two main BARF NCS stations claim that all this QRM is
*from members of the two nets that used to be on the frequency. Apparently,
*the BARF boys get up early and stay late, establishing "frequency rights".

[more stuff omitted]

Shades of "Transmitting Music for ATV". It seems we have some hams here
who are interpreting the letter of the law to mean something that some
other hams don't agree with. The difference is that since they probably
don't have access to the "net" to talk about it, they have decided to
DO SOMETHING about it. On the other hand they might simply be mad at
someone on 14.313 and decided to use a strict interpretation of the rules
to "get even". In either case it is a worrisome aspect. If the FCC gets
involved and makes a ruling, I suspect we will all lose.

This issue is exactly what I was trying to get at when talking about rule
interpretation on the "Music" subject line.

SpaceNews

MONDAY SEPTEMBER 11, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* STS-34 NEWS *

The Terminal Countdown Demonstation Test with the STS-34 flight crew is presently scheduled for September 14 and 15 at the Kennedy Space Center. The tentative launch date for STS-34 and its Galileo payload is October 12th.

* UoSAT D/E NEWS *

With only a few weeks to go before the flight version of both spacecraft have to be ready for environmental testing. Engineers at UoSAT have assembled and tested the first "full scale" engineering spacecraft including most of the modules, the batteries and the harness. Except for some minor problems, all systems interfaced really well and data was sent and received over the various networks. Also, the UoSAT-E CCD camera was fully tested and pictures of exceptionally good quality are now being produced via our ground based transputer system.

* VOYAGER-2 FINDINGS *

Larry Soderblom, Deputy Imaging Team Leader for the VOYAGER-2 project, concluded that Triton's surface appears to be geologically young. According to Dr. Brad Smith, VOYAGER imaging team leader, commented that the features that appear to be craters are almost certainly not imapct craters, but must be related to internal processes within Triton. No other single body in the solar system contains all those terrain types.

Neptune's magnetic field was found to be tilted 50 degrees from the planet's rotation axis, according to data obtained from the plasma and low-energy charged-particle instruments carried on VOYAGER-2.

Voyager images disclosed three more rings, according to Brad Smith. The two earlier rings are called 1989N1A, the outer; and 1989N2A. One new ring, wider than those two, lies closer to Neptune. The second new ring orbits between 1989N1A and 1989N2A. A third new ring is broad and diffuse, and extends from just outside 1989N1A, all the way to the outer edge of 1989N2A.

Mode B : MA 200 to MA 240
OFF : MA 240 to MA 003
Mode S : MA 210 to MA 222

* SpaceNews DISTRIBUTION *

David Hopkins, VK4ZF of the Australian Space Education Association would like to receive SpaceNews on a regular (weekly) basis via packet radio at the VK4XBB-1 BBS in Brisbane, Australia.

The VK4XBB system can be reached via VK4BBS (AsiaNet). At the present time, SpaceNews is being received as a bulletin that orginates in Switzerland, then passes through Holland, Indonesia, and the Philippines before arriving in Brisbane.

Could someone please distribute SpaceNews to VK4ZF via a more "direct" path??

Thanks! de John, KD2BD @ NN2Z

* FEEDBACK WELCOMED *

Feedback regarding SpaceNews can be directed to the author (John) via any of the following paths:

UUCP : ucbvax!rutgers!petsd!tsdiag!ka2qhd!kd2bd
PACKET : KD2BD @ NN2Z

* SpaceNews * >> Satellite News You Won't Find Everywhere Else << * SpaceNews *

In article <668@atlas.tegra.UUCP>, vail@tegra.UUCP (Johnathan Vail) writes:
>
> I have heard (but not verified) that the IF from the tuner is around
> 49 MHZ and can be piped into a scanner...

Here is a reprint of my article which appeared in
the February 1988 issue of "The Radio Enthusiast"
and in my column in the May 1989 issue of "The RCMA Newsletter":

CONVERT YOUR CORDLESS TELEPHONE TO 800 MHZ?

by Bob Parnass, AJ9S

Convert your cordless telephone to receive 800 MHz? Yes,
I'm quite serious.

How do you convert a 47 MHz cordless phone to 800 MHz?
With a converter, of course!

But you don't need a fancy $99 Hamtronics converter. All
you need is the UHF tuner from a spare television set
that was manufactured when TVs still covered channels
14-83. I used the solid state, tuneable UHF tuner from a
cheapie JVC television set given me a few years ago.

This tuner seems typical of the type available in TVs for
the past several years. It uses a variable capacitor,
not a varicap diode, to tune channels 14-83 (470-890
MHz), and convert them to an IF of 47 MHz. If 47 MHz
sounds familiar, that's because it is the upper edge of
the cordless telephone band. A cordless telephone is
just a full duplex 46-47 MHz FM receiver and 49-50 MHz FM
transmitter in the same case.

Since I don't own a cordless phone, I used a scanner
tuned to 47 MHz and connected its antenna jack to the IF
output of the TV tuner. My tuner required a 300 ohm
impedance antenna, so I placed an ordinary TV balun
between the tuner input and my scanner antenna.

The IF is pretty broad - at least 10 MHz, so I tune
around on my scanner, rather than use the very coarse
tuning control on the tuner itself.

This tuner lacks an RF amplifier, so it's not as sensi-
tive as a modern 800 MHz scanner, but I sure hear a lot
of stations between 460 and about 890 MHz!

My tuner works well when powered at 6-9 VDC, and since it only draws about 10 milliamps, I use a 9 volt alkaline battery. An article in January 1988 Ham Radio Magazine describes other TV tuners, and suggests ways to put them to good use.

WARNING: Listening in on mobile phone conversations is now against the law.

2545. Questions on Icom UX-14 serial interface

Newsgroup: rec.ham-radio
Date: 1989-09-09 20:47:10 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <164778@Wayne-MTS>
Source record: 17123

I'm over at the house of KR8S, looking at his new UX-14 he purchased
for his Icom 751. This $75 box is normally used with a $100 serial
TTL->RS-232 converter, but s it's going to be hooked to a C-64, it
would probab;ly be easier to just go TTL<->TTL, right?

So: The Icom module has one (*1*) Transcieve line; the C-64 has the
standard seperate transmit data/receive data lines. What's the
preferable way to tie these together? (forgive a poor displaced
psycholinguist his ignorance).

This may well have been covered before, but as I don't have a 751
I'm sure I would have missed it...

Just a note about the BARF Net and the folks on the Maritime Mobile net.

A friend of mine, NT7S was down in Central America recently when he found himself in a bit of a quandry. His father had died unexpectedly while on vacation in Turkey. John needed to leave Managua suddenly, and found a flight that would get him back to the USA. He was trying to phone a friend in California to let her know what was happening, but he could not dial out of the country after trying the telephone ALL DAY. So he got on one of the nets around 14.313 and found a station who could assist him with a phone patch.

During the patch, one of the clowns from 14.313 (think it was the -5- mentioned in Gary's posting) came on and started QRMing the patch with a long winded harangue about how the patch was in violation of FCC rules. John tried to explain his situation with the phone service, his father dieing, etc. The -5- said that he was sorry, but that only communications that by their very nature were too inconsequential to be carried over commercial telephone networks were legal over ham radio! John tried again to explain, but the guy QRMed the patch by reading FCC rules to him. John tried to tell the -5- that HE was in violation of FCC rules concerning malicious interference. Finally the US station who was handling the patch gave up, and so did John.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

In article <8909090426.AA03181@apg-tecnet.apg.army.mil> mgb@APG-TECNET.APG.ARMY.MIL writes:
> [...] It even came up in reference to modem
>design when digital encryption was used to "smooth" the signal on a 56 kbs
>system.

If you're referring to the WA4DSY 56k modem, as I suspect you are, then your use of the word "encryption" is incorrect. Encryption is the reversible transformation of a signal to make it unintelligible to all but the authorized receiver who possesses the necessary information (the key) to decrypt it.

The correct term for the circuit in the WA4DSY modem that "randomizes" the statistics of the signal is "scrambler". This word has a very precise meaning in modem design: the reversible transformation of a data stream to make it appear "random" to aid in clock recovery, to eliminate data pattern sensitivities, and to reduce interference by eliminating discrete spectral components in the signal spectrum.

Note that while the two processes are superficially the same, they are done for two entirely different reasons. An encryption device could serve as a modem scrambler but the reverse is seldom, if ever true. Although both scrambling and encryption use pseudo-random algorithms, an encryption algorithm must meet far stronger criteria for "randomness" than a scrambler; i.e., it must withstand a concerted cryptanalytic attack. Modem scrambling algorithms need meet only a very weak statistical test for randomness; they need not have any resistance to cryptanalysis. In addition, they are almost always standardized and published, which provides the information required to intercept the data without any cryptanalysis at all. These two properties apply to the WA4DSY modem scrambler, therefore it is not an encryption device and the word "encryption" should not be used to describe it.

Part of the problem comes from the widespread misuse of the word "scrambler" with respect to video encryption systems on cable TV or satellite.

Phil

2549. Rules interpretation/License Required Before Purchase

Newsgroup: rec.ham-radio
Date: 1989-09-10 01:31:00 UTC

> to argue, but only the legal beagles can actually settle something like
> this, and then only after someone has been charged with a violation.

Given our service is suppose to be self-policing, shouldn't we encourage an examination of the rules. True, the debate sometimes becomes silly...often becomes silly....but that is part of the process, and for some, part of the fun. Look at it this way, you are GOING to have a personal interpretation of the rules. It is better to have developed a personal interpretation of the rules based on a free examination of those rules, and a free examination of those rules includes expressions of personal interpretations. True, the final arbitrator of the "true" meaning of the rules will be the courts and FCC; but our purpose here is not to determine rule interpretation in a legally binding way, but to provide a mechanism where personal interpretations can be developed and changed in a forum of free debate. Who knows, we might even develop a consensus. 1/2 :-)

And, regarding another issue in INFO-HAMS: What is illegal is transmitting on ham frequencies without a license. Possession of a device to do so is not (even though there are very few legal uses for a ham transmitter to a non-ham, unlike with the car and guns analogies). However, I can certainly understand why many hams feel uncomfortable with non-hams owning ham radio transmitting equipment. A person with a transmitter can use that device to cause interference to other people on a nationwide basis, with a very low probability of being caught. Also, I think there is a fear from hams of non-hams purchasing radio equipment, using them illegally with almost no chance of being caught, and a "critical mass" being reached where non-hams can find plenty of other non-hams on the ham bands, and turning the ham bands into a "bigger and better" CB service. Mechanisms to reduce to probability of such illegal activity occurring (the prevention side), or to increase the probability of being caught (the enforcement side), have been proposed from time to time (remember the embedded callsign ID the FCC proposed a short while back?) Is it really so outrageous to seek mechanisms to keep the ham bands for hams? Or are we to ignore the problem? Or do you believe that there is no potential danger? :-S (a Serious question)

Any one wanting more information on Phil Karn's tcp/ip software for amateur packet radio should feel free to contact me about it. See my message below.

Sent: 09/09/89 10:28 Rcvd: 09/09/89 11:01 Number: 59
To: tcp-group@ucsd.edu From: Doug Yuill
Subject: Distribution of NET

It seems we see lots of requests for NET executable's for the various machines that NET has been ported to. Is our distribution mechanism so ad hoc that we don't have a current (to within 12 months) list of people who will send you NET for your particular hardware?
I would like to offer to distribute NET for the Macintosh & IBM pc for a DONATION of $15 to our local working group. I expect to have both the the old version and the new version of NET for the Amiga and if Rob wants to send me his Atari version I'll send him the current Mac distribution. Any other keepers of the bits (do we have a xenix port?) who wish me to distribute there versions of NET please send them along.
As I have an interest in user testing I may also be able to provide help in cases where potental NETer's get hopelessly lost in the documentation.
Please mail your disks or dollars to:

I'm looking for persons who are interested in a project to build and launch an amateur radio satellite. This is expected to be a big project lasting many years with the general requirement to put a geosynchronous device in orbit for amateurs.

I myself am an electrical engineer in the communications field who does, from time to time, work in the satellite industry. My Call sign is VE3RBI.

If you are interested, please leave me a note on this system, indicating your interest and a short statement of your talents. If I can find enough interest and talent, we'll go at it.

This message originates at CRS, Toronto, Canada.

>system.

*ka9q.bellcore.com!karn@bellcore.com (Phil Karn) writes:

*If you're referring to the WA4DSY 56k modem, as I suspect you are, then your
*use of the word "encryption" is incorrect. Encryption is the reversible
*transformation of a signal to make it unintelligible to all but the
*authorized receiver who possesses the necessary information (the key) to
*decrypt it.

[complete description of randomizing omitted]

I thought you might come out of the woodwork with that example Phil, even
though I was rather ambiguous with my reference! (There just aren't that
many 56 kbs modems around!) :-)

I was NOT suggesting that this modem was illegal or fell into the category
of using encryption... well yes I did use the word encryption. The point
I was trying to make was that those that read the reg. on the issue of
encryption could very easily look at the method used in this modem and
say "this is encryption .. ergo .. it is illegal". They would argue that
your definition of randomizing is just "looking for loopholes".

I used it as an example of something that IS legal, that by trying to apply
STRICT INTERPRETATION of a rule could be argued to be illegal on very similar
grounds as this "music" thing.

Thank you for (correctly) pointing out my inaccurate use of the word encrypt
in reference to this modem without going into the necessary detail that I
should have.

>Your attitude fascinates me. Tell me, just what is the basis of your intense
>interest in safegurding access to radio transmitting equipment by people who
>can't lawfully use it? Sounds a bit odd to me.

Not at all.

When was the last time you saw a transmitter without receive capability
built into it?

Now, I ask, suppose I am thinking of getting a HAM license. I want to buy a
two-meter (fer instance) transceiver, perhaps an HT -- why purchase two
pieces of gear when I only need one? Sure, it's illegal for me to key that
microphone until I get my license -- but it's not illegal for me to LISTEN.

The basis of MY intense interest in safeguarding access to the equipment is
simple -- I want to purchase the thing before I get my license. I want to
use it lawfully (which can be done) before I get my license, become familiar
with the controls, etc.

The situation is similar to owning a car. It's not illegal or improper to
purchase (or own) a car without a driver license or even registration
certificate. It is illegal (and improper) to operate it without that same
license (and registration).

I'll vote with my wallet. I'm considering getting involved in this hobby,
and intend to purchase my first set before I get the call letters. The
outfit that is willing to sell to me without my showing them a license
and/or giving a set of call letters (which I won't have) will be rewarded
by my continued patronage. Those places that choose not to will be told
why they're missing out on my money.

re: 'BARF' vigilantes going to war against the traffic nets on 14.313 MHz
because they don't approve of the nets' phone patch operations.

I've monitored the rudeness around 14.313 MHz for many, many months, and
it has really turned me off to operating SSB. The jamming, personal
attacks, tirades, bigoted remarks and other nonsense are extremely
poor operating practice and an embarrassment to Amateur Radio.

point 1) This vigilante nightmare is self regulation gone wild.

point 2) Is it trendy to be rude? :-(
Perhaps the rudeness is just a sign of the times. I hear
similar antics encouraged by hosts on AM radio talk shows and some
newsgroups on own beloved Usenet are blighted with unhealthy
doses of it.

U.S. hams may want to obtain the Macintosh version from:
Doug Thom N6OYU
1405 Graywood Drive
San Jose, CA 95129

Doug is the project coordinator for the Macintosh port, so he always
has the latest version.

In Europe, Jean-Pierre Szikora (LUDWIG@BUCLLN11.BITNET) has offered
to provide the same service. He's at:

Institut Ludwig
74, av. Hippocrate UCL7459
B-1200 Brussels Belgium

Please send a blank (preferably formatted) 800K disk with a return
disk mailer and appropriate postage or IRCs.

Remember--this is for the Macintosh version only! You DOS folks are
on your own. :-)

2558. How hard to build a DISCONE antenna?

Newsgroup: rec.ham-radio
Date: 1989-09-11 03:57:24 UTC
From: flash@lopez.UUCP
Message-ID: <777@lopez.UUCP>
Source record: 16883

Being the proud owner of a new PRO-2005 scanner, I have found that in order to receive all the things I wish to receive, an OUTSIDE antenna is in order. I have hooked it up to to my 2 meter antenna, and find this brings in stations very well on LOTS of frequencies. It is a compromise situation though, because now I have to switch antennas to operate on 2 meters.

I also think that an antenna that is MADE for wide band coverage is in order.

Well looking at everything available, I am convinced that the DISCONE provides the best coverage (albeit at unity gain), and talking to people that use them, everyone I know that has one is happy with it.

BUT THE PRICE!!! Gack. 60 to 100 dollars for a twinky antenna? This borders on semi outrageousness.

One should be able to build one. The problem is, I have not been able to locate any formulas or measurements in any of my books.

Hence, a request to the NET. Has anyone ever built a DISCONE antenna? Is there an article or project anywhere with instructions?

I would like to make mine out of some extra #6 copper wire I have laying around. The stuff is stiff enough to hold the shape, I think.

Anyone with information, Please drop me a line, or post to the net.

THANKS a MEGACYCLE.

PH> will encoruage other hams to choose the same way so that dealers,
PH> who are in the business to make money, will see that restricting
PH> sales of ham transmitters to hams is the way to go.

Wouldn't it be wonderful if there were a way to manufacture all Amateur transceivers so that they could recieve perfectly well, but have to be "unlocked" by some authority ONLY upon the purchaser displaying his Amateur Radio license (or a photocopy). If this were technically feasible and virtually undefeatable by electronics whizzes, the rigs could be confidently displayed and sold through just about ANY retail outlet imaginable.

I see the following advantages:

A) More unlicensed "civilians" could buy Amateur rigs to listen in and gain enthusiasm to become licensed.
B) Manufacturers could seek more retail outlets (i.e., Sears, J.C. Penney, etc.) and expose their products to more people, thus improving public awareness, and helping lower prices through larger volume sales.
C) SWLs could obtain better-quality radios for coverage of certain frequencies, and keep them if they subsequently chose to earn Amateur Radio licenses.

The only real problem would be the outlaws (see "CB radio users") who would inevitably obtain used gear that was already "unlocked" and use them to transmit, Amateur license or not.

I suppose this would also add to the cost of designing and building Amateur rigs <sigh>.

Mark,

In your reply to Phil, you wrote:

P>> Since the wording of the rules refers to "music" with no
P>> qualifications,I personally suspect that it can be interpreted
P>> to mean that music in any form cannot be sent...Digital input
P>> files for music playing programs is a form of music just as...much
P>> as an analog waveform of the sonic vibrations is...Even a TV or
P>> FAX image of sheet music is still music...I doubt that these cases
P>> I mention will be as vigorously prosecuted as a blatant
P>> transmission of Beethoven's 5th over the local repeater using FM
P>> mode and the sound of the music...

Don't some people ever get the point of the *intent* of the laws? I
don't think the FCC thought that Amateurs would be so goofy that they'd
misunderstand what was meant by the term "music". Given the context of
the rule, in view of the fact that it's under Part 97 which deals with
Amateur Radio operations, as clearly distinguished from broadcasting
and other entertainment media, it's certainly clear that the FCC was
referring to the kind of music that you hear; i.e., the stuff that
comes out of musical instruments or on LP records, cassettes, CDs, and
so on.

P>> I just bring up this point for you to think about before you try
P>> to "loophole" your way around the rules (I see no loopholes).

I think he only brings up this point because he's bored and can't
think of anything more valuable to post here.

THE RACKET ON 14313 KHZ IS LOUD AND CLEAR IN IRELAND :
I agree with k4nuj and his group. I do not care about the intricacies of FCC rules on patching ... the jamming is so deliberate and provocative that his anger is justified.

Interesting politics there too - freq. reference to drug smugglers and criminals, to Senators and election races ...

I don't expect a problem. After all, European LW stations on channels used for
US beacons now operate at up to 2000 kW, whereas the Irish st. will only use
600 kW maximum power. There are also relatively powerful LW outlets from France, FRG,
Norway,
UK, Norway, Poland, Czechoslovakia, Sweden, FRG and USSR.
ATLANTIC 252 may cause QRM to RTA 3 Algeria after 17 UTC.

My IBM PS/2 monitor (8513) is susceptible to RF. Half a watt at 440MHz applied
to the right hand side blanks the screen. You have to power the monitor off
for about 10 seconds to get it to work again. Try it! Its fun to walk into
someones office with a rig inside your jacket, and key up. The howls of
amazement when people's screens go dead are quite wonderful. Wonder when
IBM will screen their screens(?) properly?
At least the PS/2 has a metal case and generates less RFI than the
old VT100 i used to use - that had s9+40dB hash all the way to 900MHz.

The IC22S synthesizer takes an 8-bit number which is the number of 15kHz steps above 144.39 MHz. You can drive these inputs with the output of an 8255, 74LS373, or other typical TTL structures. Just turn the dial to the blank channel position and jam your bits in.

My remote base has been using this exact scheme to provide a fully synthesized 2m transceiver ever since I built it around 8 or 9 yeas ago. The CPU calculates offsets and splits and simply changes the synth setting as you go from rx to tx and back, so there's no need to fiddle with the offset switch on the radio.

Note that the PLL in the IC22S probably won't lock below about 145.8 unless you tweak on it.

A runner could be arrested for any number of other charges, including "reckless self-endangerment". I remember once at the police department I worked at an officer ticketed a car illegally parked. The smartass owner said, "You can't do that; this is not a motor vehicle." He opened the hood and showed the cop that, indeed, the engine had been removed for repairs. The officer shrugged, said "OK, have it your way" -- and wrote out a ticket for littering.

In that town the fine for littering is about four times the fine for illegal parking. [:-)

2571. Arpanet/Usenet Arguments (medium size)

Newsgroup: rec.ham-radio
Date: 1989-09-11 14:58:40 UTC
From: ptb@MBUNIX.MITRE.ORG
Message-ID: <8909111458.AA04732@mbunix.mitre.org>
Source record: 16909

I have a few points to make about the debates currently going on about PIZZA autopatches, the communicator license class, Morse Code, 14.313, frequency coordinators, buying a transmitter without a license, etc.

A. Isn't it interesting how most of the postings that "go off the deep end" seem to be done by the same people all the time.... I wonder if they are really more expert than the rest of us, or just more argumentative. This is not meant to "flame" any particular individual, the goal is to try and sensitize people to think before posting.

B. A phenomonon of "delayed mass response" seems to happen whereby we see the initial posting, then a few days later, oodles and oodles of "you can't do that on ham radio", and then another round. A poster really needs to know that this media gets read by lots and lots of people from all over. Some questions may be better asked of someone whose viewpoint you know and agree with rather than asking a bunch of strangers with possibly very strong feelings pro and con.

C. I do not at all appreciate people who try to force their opinion on me about a rule as though their opinion itself was the rule. It is one thing if an official interpretation was made of a rule that seems contrary to what one would expect. In that case, we would need to know and be careful so that we don't get in trouble. Also, we need to know about rules or laws that are passed that seem to go against what a lot of people are doing (eg., the ECPA).

D. To my way of thinking, an inflammatory ".signature" about such controversial issues as abortion, support for assault rifles, capital punishment, support for some politician, etc. (a) is an invitation for a flame, and, (b) probably is not in the correct forum (try rec.politics).

E. Some of the postings that I have read recently kind of remind me of two old proverbs:

1. Be sure brain is running before engaging mouth (or usenet).

2. The person who thinketh by the inch, but talketh (or typeth) by the yard deserves to be kicketh by the foot.

Disclaimers:

Obviously (I hope), these opinions do not necessarily reflect the opinions or policies of my employer, or its employer, or ....

I am not involved in any violation of rule or law that I know about.

> probably for the ATV people to move to a higher band, like 902 (where I
^^

Actually the real solution is for the FM'ers to move to 900 or
1200. The ATV'ers are dealing with a much much wider signal (ie. 6 MHz vs
5 KHz). The power density is much lower for a given amount of power.
The noise power is much higher than for narrow band signals.
ATV'ers need a band that will propagate well if they are going to overcome
all of the wide band disadvantages and work any distance at all. These types
of losses are more easily delt with in a narrow band system. There are
plenty of 1200 MHz FM base, mobile, and HT's available commercially.
ICOM even recently introduced a new dual bander 440 and 1200 mobile rig !

> occupied bandwidth. I turn bright purple evry time I think of those
> idiots at PC Electronics selling ATV transmitters with absolutely no
> bandwidth-limiting devices built in.

I can understand your anger. There really should be VSB filters in the
rigs. If you operate a lot on 1 frequency you can buy VSB filters from
Spectrum International in Concord Mass. I believe these can be attached to
the back of the rig.

2573. Help with Satellite Info

Newsgroup: rec.ham-radio
Date: 1989-09-11 18:58:19 UTC
From: mgb@APG-TECNET.APG.ARMY.MIL
Message-ID: <8909111858.AA27316@apg-tecnet.apg.army.mil>
Source record: 16910

Off the issue of rules and regulations (finally), I would like to ask for some help finding some information on satellite data.

My desire is to be able to directly receive and convert for viewing information on sea water surface temperatures for the eastern seaboard of the United States. The result of numerous phone calls has led me to believe that there are possibly two birds that transmit this information as a result of an infrared scan. I believe that one is French and one is Soviet, and I have been told that they both transmit somewhere in the VHF range.

This data is obviously being received somehow since there are various commercial enterprises that SELL this information. :-((They will not give me any info.... wonder why?) If someone could point me in the right direction on who to call, or tell me where to look in some publication, or better yet, tell me the frequencies, the method and techniques used and how to build same, I would appreciate it very much.

If I can get this information and then build a successful project I will post the results to the net if anyone feels it of interest.

Now that I have finally entered the wonderful world of HF, having spent far too many years limited to VHF, the DX bug has bit. However, I would like to refresh myself on a little radio propagation theory, and add to what I've learned so far (up thru the Advanced theory). Can anyone out there recommend some good sources of information?? I'm not looking for heavy science or math, doctorate thesis material, or anything like that; just some good foundation material and enough reference so that I can make some sort of sense out of the WWF Solar Index broadcasts and the ARRL Solar Flux bulletins. Back articles in QST, books, whatever sources you can name would be greatly appreciated!

Thanks in advance, and 73!!

Not to belabor the point, BUT I was talking about the occupied bandwidth at
100 dB down, not the minimum receiver bandwidth needed to reliably recover
the modulation.

Your point of predictability is well taken, but at 100dB down, slight
imperfections in the implementation may be more important than the theory.
At least the theory should point us away from hopeless schemes.

Thanks for your comments, a welcome change from the pizza wars!

Boy I guess you do need to refresh yourself on propagation theory. How did you ever get your advanced license? Certainly you know that DX is very possible and worked every day on the VHF/UHF/SHF bands! DX to the tune of 1500+ miles, with even modest equipment.

Pardon the flames, but I couldn't let this go unanswered.

> > can't lawfully use it? Sounds a bit odd to me.
>
> The basis could be that THE RIGHT TO OWN SOMETHING and THE RIGHT
> TO USE SOMETHING are DIFFERENT! Doesn't everybody understand it?

Of course it is different. I was suspecting that you didn't know they
were different. Your arguments have been using the RIGHT TO OWN as their
basis. My arguments have been for a voluntary policy by dealers to sell
ham radio transmitters only to licensed ham radio operators. It does NOT
affect anyone's right to own.

> Can you drive your car legally above <your speed limit - something
> like 55mph>? If no - maybe you can't own it, since it's capable of
> running with that speed?

The car is ALSO capable of operating BELOW <insert your speed limit here>.
If a transmitter is LEGALLY capable of operating in a service OTHER THAN
the Amateur Service, then I would NOT suggest to the dealer to withhold
selling it in that service.

My suggestion is to NOT sell the transmitter unless the buyer has SOME
legal use for it.

If I were to use the line of arguing you claim I did, I'd have to suggest
to dealers not to sell to hams any transmitter capable of operating out
of band (unless they can prove they are allowed to use ALL frequencies).
In fact I only suggest they prove they have SOME legal use of the transmitting
capability.

I will also NOT buy cars from car dealers that sell cars to children.

> And sometimes people just want to own something they either can't
> use right away, or can't use at all. It's THEIR business, anyway.
> Why should anybody else meddle into it? MYWB!

Your kid works three years as a paperboy working 3 routes both mornings
and evenings. You are proud of him/her for working so hard. Now at the
age of 15, he/she decides to buy a car. He/she goes to the dealer with
the cash in hand (or bank check) and buys the car on the spot.

> the chemicals that are used to make the drugs.

A radio receiver is necessary for broadcast radio to become the music we hear. If a ham continuously transmitted the music input file, someone COULD tie a receiver into a computer and play the music in real time just as much as they could if the file being sent was a set of numbers that represent the waveform. I believe that REPRESENTATIONS of music are just as much music, because that's what it all is anyway. Literally, music is just the vibrations of the air in a pleasing manner. I could TRY to argue that my over-the-air transmission is just a REPRESENTATION of the music and not the music itself. I don't think the FCC will agree.

> And the sign said "No Smoking" but that doesn't mean you can't light a match.

> the FCC!!!!

Laws often get changed when this happens and it is found that the law prohibits what people believe should be allowed. The reverse is often true as well. The decision not to change the law (and the FCC does get an occaision petition to remove the rule) now certainly implies to me that they see no valid exceptions. Maybe they didn't consider it carefully enough; why don't you petition the FCC to change the law. How would you have it written? If you believe the current law does not apply to everything as I believe it does, what wording WOULD apply to everything?

You can follow both. You can express your opinion and ignore mine. You can express your opinion about my opinion (and you are). I can ignore you if I want (and I have not). Those two paragraphs have are not contradictory (...in my opinion)

I did say "think about it". I want you to interpret it for yourself. If you get confused in the process, hire a lawyer. I do interpret the rules for myself, and I posted how I do interpret them. I have not said you must interpret them my way.

> Why try to look at a regulation with an eye towards prohibiting something

> experimentation in new areas are counterproductive to us all as ham radio
> experimenters and operators.

Why? Very simple.... times change, and sometimes rules need to change as well. If what we are doing now might be potentially illegal, and we might not know for sure until a case goes to court, then perhaps we should think about what we want to be legal and illegal, and get the rules changed to go along with that. If we want music to be prohibit only in emission modes which are also used in the broadcasting service regardless of deviation in the case of FM, then we shoul ask the FCC to write the rule that way.

> If a rule is going to be "pushed" in one direction or another, I suggest
> that it be pushed to the side that allows new ideas and methods to be tried
> and perfected and not to the side that restricts us before we even get going,
> especially when there are no precedents to indicate otherwise.

Ordinarily I agree with you. I see this particular rule, however, as one that is very firmly rooted and UNPUSHABLE. No rule is unchangeable.

> Is that a "radical" point of view? (I'm asking, not telling)

No. It is NOT radical. There are some cases it might not have the best effect, and I am trying to say that we have one here.

Rules are often intepreted in courts by their exact wording, as argued, and not always as we feel they should be. I believe that shipping a file of music input should be legal because it does not violate what I believe the SPIRIT of the rule to be, which is a hardline prohibition

of broadcast-like entertaining material. An example of something that MIGHT be a violation of the spirit, but I can see no rule against, is the reading of poetry over the radio; but let's not flame over that one.

> ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
> do they have to prove it to you, or just to the dealer?

No. They just need to be "sponsored" by ANY ham.

> > ham, and can contact the ARRL to find a ham. Dealers who follow my principle
> ^^^^^^^^^^^^^^^^^^^^^^^^
> let's hope businessmen have more of common sense

We disagree on what "common sense" is.

> > can also give suggests, and they probably have a database of hams that have
> > purchased from them anyway.
> ^^^^^^^^^^^^^^^^^^^
>
> Why some snobs are so much against the right of other people (who didn't
> have the luck yet to wear the same sheepskin as you) to own something?
> Come on, it's not from your pocket. Oh, sorry, I forgot - you're
> defending the IDEA...

READ MY POSTING AGAIN!!! Read it 1024 times if you have to. Eventually you
will see that I have NOT said ANYTHING where I am against non-hams owning
radio transmitters. I am only against dealers who actively sell equipment
they know to be amateur transmitting equipment TO THE EXTENT that I personally
will prefer to buy from a DIFFERENT dealer since I do not want to be
associated with it.

> > The ham-candidate trying to buy a radio from a dealer can get a referral
> > from the dealer to a local ham, so I see no major problems.
>
> Very stupid. What if there's NO local ham? What if I don't want to deal
> with particularly that local one? And why the hell should I?!

A decent dealer would be able to find other ways to help the candidate ham
who had this problem. Local might be many miles away, but surely many hams
(the good ones anyway) would be willing to travel a little distance to help
a person become a ham radio operator. ARE YOU SUCH A HAM?

> > Sale of legitimate CB's and 49 Mhz stuff would not be affected since anyone
> > can legally use them.
>
> Thank you very much! You're soooo kind...
> BTW, can you own a gun? Can you legally use it? What about
> Commando knife?

I would prefer to buy my guns from gun dealers who did NOT sell guns to people who were not at least knowledgable about guns in some reasonable way. In cases where permits are required TO USE, I would not buy guns from dealers who sold such guns to such persons.

This anology is not a good one because the legalistics are very different. However, IN BOTH CASES I AM AGAINST RESTRICTIVE LAWS.

There are some money grubbing and crooked GUN dealers out there, too.

> > Definitely NOT pointless, comical or eccentric, as your "straw man" posting

>
> Let's hope there's not enough of such agressive "straw head"... oops,
> "straw men" to make it really serious. And if you have nothing else
> to do - well, it's your time. You may waste it in any way suitable
> for you (yup, even without asking my permission. And _I_ don't care
> what you'll buy and where from, and how thick the bunch of papers is
> you're going to present to prove that YES, YOU DO HAVE A RIGHT TO OWN
> THAT THING).

The issue is NOT whether one has a right to own the thing since EVERYONE does have that right. I do NOT want to change the rights either. Dealers ALSO have the right to NOT sell you a radio transmitter for any reason they choose except some specified by law (race, sex, religion, etc.). I have the right to choose to buy my radios from dealers who have made what I consider to be wiser choices in the way they do business.

Yes, I have been wasting my time lately... fighting 87-14 to save 220-222 Mhz and trying to get a DECENT form of a no-code license that is going to happen eventually in some form anyway. I also wasted a lot of time lately in helping to publicize my ham radio club's Novice class. And who knows how many hours I have wasted on the air.

> -> can't lawfully use it? Sounds a bit odd to me.
>
> >The basis could be that THE RIGHT TO OWN SOMETHING and THE RIGHT
> >TO USE SOMETHING are DIFFERENT! Doesn't everybody understand it?
>
> I bought my son a Heathkit HW-8 as an incentive for him to get his license.
> Why not?

No reason not to. You knew very well that your son was not particularly
planning to make illegal use of it.

> I own lots of stuff I can't legally use (like a scanner that can receive
> Cellular Telephone transmissions).

Aside from the fact that I believe the ECPA to be misguided legislation
(dare you even take a poll on here) that scanner has many obvious uses other
than to listen to cellular. The cellular coverage is incedental. For a
transceiver, the transmitter coverage is NOT incedental; it is obviously
expected to be a major part of the radio. This is why I believe the scanner
argument is not applicable.

2585. Re: Transmitters & non licensed people

Newsgroup: rec.ham-radio
Date: 1989-09-12 06:16:30 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500190@ux1.cso.uiuc.edu>
Source record: 16898

The cellular base transmitter frequencies are 870.03 Mhz to 889.98 Mhz in steps of 30 khz. The mobile frequencies are 825.03 Mhz to 844.98 Mhz. The old UHF TV channels are:

70 806-812 (811.75 audio)
71 812-818 (817.75 audio)
72 818-824 (823.75 audio)
73 824-830 (829.75 audio) <-- overlaps mobile
74 830-836 (835.75 audio) <-- overlaps mobile
75 836-842 (841.75 audio) <-- overlaps mobile
76 842-848 (847.75 audio) <-- overlaps mobile
77 848-854 (853.75 audio)
78 854-860 (859.75 audio)
79 860-866 (865.75 audio)
80 866-872 (871.75 audio) <-- overlaps base
81 872-878 (877.75 audio) <-- overlaps base
82 878-884 (883.75 audio) <-- overlaps base
83 884-890 (889.75 audio) <-- overlaps base

Harmonics of HAM BANDS:
144-148 Mhz 6th harmonic is 864-888 Mhz
220-225 Mhz 4th harmonic is 880-900 Mhz
420-450 Mhz 2nd harmonic is 840-900 Mhz

A good ham will of course check to make sure he is not radiating harmonics that could interfere with other radio services.

From: GB7HQQ@GB7HQQ

Vange Amateur Radio Society is holding its tenth annual mobile rally
today; the event opens (opened) at 10am and will close at 5pm. The
venue for the rally is Nicholas School in Nicholas Lane, Basildon, and
talk-in is available on S22 via GB4VMR. Approach roads are signposted,
and adequate parking is available. The usual traders are in
attendance, and if the weather permits there will also be a car boot
sale in the school grounds.

The Lincoln Hamfest also takes place today at the Lincolnshire
Showground, about five miles north of Lincoln on the A15. The event
opens at 10.30 am and talk-in is available via G5FX on S22. The usual
trade stands will be present, together with a number of attractions
for the family.

The Scottish National Amateur Radio Convention takes place next
Saturday, the 16th of September. The venue will be the Institute of
Physical and Recreational Education in Glenrothes and the event will
open at 11am. Talk-in will be available on S22 and 145.2MHz. More
information is available from GM4ALA on 0592 742763.

The 430MHz port of the Midlands AX25 Group's digital repeater became
operational on the 1st of September. Its callsign is GB7AP and it uses
the S.S.I.D. Dash 7. The unit is located at Lichfield in Staffordshire
and the frequency is 432.675MHz. More information is available from
Bob Evans, G8KHV.

The 430 and 14MHz ports of the Guernsey packet mailbox GB7GUR have now
returned to service following an overhaul. Frequencies are 432.675MHz
and 14.103MHz respectively.

The Lewes UHF repeater GB3LR is off the air for routine maintenance,
as is the south-west Hertfordshire repeater GB3HR.
```

Two repeaters have returned to service - GB3NA in Swansea on channel R3 and the North Sussex repeater GB3NX on channel RB2.

A reminder to CW enthusiasts that the GB2RS news is also broadcast on CW on 7047.5 kHz every Sunday morning. The broadcast begins at 10am with a general call, and general news items are sent at 30 words per minute beginning at 10.05am. These are repeated at 26 words per minute at 10.10am. At 10.15am the propagation information is transmitted at 22 words per minute, and then at 10.30am the main news is repeated at 18 words per minute. This is then followed by a lower sideband transmission of the news at 11am. Reception reports on both morse and voice bulletins are taken by G3LEQ at 11.40, and reports may also be sent to him directly.

The Post Office has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0MH and G7FR series.

To: NEWS@GBR
Subject: GB2RS 10 SEP (2/9): SOLAR NEWS
Path: GB7NWP!GB7CDM!GB7DQW!GB7SUT!GB7LRG!GB7SPV

From: GB7HQQ@GB7HQQ

There was a steady increase in solar activity during the period between the 25th of August and the 3rd of September; many flares up to X2 2B and ten flares of up to 5,000 flux units were recorded. A magnetic storm commenced on the 28th of August and the A index had reached 34 units by the 29th. There were a number of ionospheric disturbances, and a proton flare alert and mag alert were issued on the 4th of September.

The sunspot count varied between 97 on the 29th and 294 on the 3rd of September. Solar flux levels increased steadily throughout the period, from 158 units on the 25th to 242 units on the 3rd; the average for the period was 188. The geomagnetic A index was mainly unsettled and averaged 12.7 units - however, it was up to a storm level of 34 units on the 29th. The radio quality indices fell to a very low level on the 29th and had only recovered slowly by the end of the period.

The sunspot mean for August was RI 166.8, with a maximum of 227 on the 5th and a minimum of 50 on the 28th. The forecast for August 1990 is 138, plus or minus 50.

And now the ionospheric data for England and Wales. The daytime F2 critical frequencies at Slough as reported by Appleton averaged 8.4MHz, although they declined from 9.5MHz on the 25th to only 6.6MHz on the 29th. They had only slowly recovered to 9MHz by the 3rd. Darkness hour lows averaged 3.9MHz but they varied between 4.9 and 2.4MHz. There was some Spread F between the 28th and the 30th, and other phenomena were present for up to eight hours on some days. The only good days were the 25th and the 2nd.

And now the ionospheric data for Scotland and Northern Ireland. Unfortunately, not all the usual data is available this week since there seems to have been some equipment failure at South Uist. However, for the periods between the 25th and 27th of August and the 1st to the 3rd of September, the daytime F2 critical frequencies averaged 8.1MHz; there was hardly any day-to-day variation. Darkness hour lows averaged 3.8MHz but they were affected by Spread F, which lasted for up to eight hours on some days. Other phenomena also lasted up to eight hours on most days of the period. All in all, there was no good day.

And finally the solar forecast. The more active side of the sun will be facing Earth this week, and solar flux levels could reach around 250. The geomagnetic index is expected to be very unsettled, and there is a fifty per cent chance of auroras today or tomorrow. Ionospheric M.U.F.'s at equal latitude during the day should be about 27 MHz for the south and 24 MHz in the north. Darkness hour lows may be affected by the higher geomagnetic levels, but 10 MHz should be possible.

Wirral & District Amateur Radio Club meets at 7.30pm at the Irby Cricket Club, Mill Lane, Irby for a talk on packet radio by G4OAR. More information is available from G0JZP on 051-648 5892.

Meetings on Thursday the 14th

Fylde Amateur Radio Society meets at 7.30pm at South Shore Lawn Tennis Club, Midgland Road, Blackpool for a showing of the ARRL video 'The New World of Amateur Radio'. More information is available from G4CSA on St Annes 720867.

St Helens & District Amateur Radio Club meets at 7.30pm in the Community Resource Centre, College Street, St Helens for the annual general meeting. More information is available from G0CXT on 0744 819258.

Meetings on Friday the 15th

South Manchester Radio Club meets at 8pm in the Sale Moor Community Centre, Norris Road for a talk on long-distance underwater communication by G4SYC. More information is available from G4BZO on 061-231 5870.

Maltby Amateur Radio Society meets at 7.30pm in the Mission Hall, Clifford Road, Hellaby for a talk on microlight flying by Roy Luke. More information is available from G1PQW on Rotherham 814135.

Finally, on Sunday the 17th the North Cheshire Radio Club will be conducting enrolments for its RAE class. These will begin at 6.15pm and take place at Morley Green Social Club, Morley Green, Mobberley Road, Wilmslow. Candidates who are unable to attend at that time may enrol on subsequent Sundays. More information is available from G3LEQ on 0565 4040.

Message-ID: <16941@GB7YAX>
From: G4BLT@GB7YAX
To: ALL@EU
Subject: "G" PREFIX NUMBER INFO
Path: GB7NWP!GB7CDM!GB7YAX

Many European amateurs are confused by the prefix numbers in British callsigns. In fact, many newer British amateurs are confused too! I hope this information will make things more clear. Note that I use the term "British" rather than "UK". This is because technically the GD/GJ/GU areas are not part of the UK!

There are 2 classes of British amateur licence. The class "A" is a full licence, and requires a pass in the Radio Amateurs Exam plus a pass in the 12 wpm Morse test. The class "B" requires only a pass in

the exam, but transmitting is restricted to frequencies above 30 MHz,
and Morse IS allowed.

This table will tell you which prefixes are class "A" and which are
"B". It refers to all G prefixes equally; eg GM/GW/GI etc., with the
exception of GB. I have used "XX" to mean 2 letters, "XXX" to mean 3,
and "--" or "---" to show that the combination is not used. The number
DOES NOT show the chronological order in which the licences were
issued; this explanation would take up too much space!

G0 G1 G2 G3 G4 G5 G6 G7 G8

CLASS A -- -- XX XX XX XX XX -- XX
XXX XXX XXX XXX ---

CLASS B XXX XXX XXX XXX

* NB: G5XXX callsigns have been used for reciprocal licences in the
past.
G6XXX/T callsigns have been used for ATV licences in the past.
G9XXX callsigns have been used for experimental licences in
the past, and were not amateur callsigns.

SUMMARY

1. All UK callsigns with G1/G6/G7/G8 plus 3 letters are class "B".

2. All other combinations are either class "A" or not used.

3. The number does not tell you in which order the prefixes were
issued.

4. This information also applies to GD/GI/GJ/GM/GU/GW prefixes. (Note
that the GC prefix was split into GJ and GU some years ago.)

5. GB prefix callsigns are issued by the RSGB for special purposes,
and do not follow the same rules exactly. (Eg beacons, repeaters,
events etc..) (I may try and assemble this information for a separate
bulletin if anyone is interested.)

6. When the G series is finished M will be used.

I hope this information is useful. If anyone spots any serious
inaccuracies then please let me know.

>John L. Cofer N 4 M H A
>COFER@UTKVX.BITNET -.....---.....-

Sorry, sir, I have to disagree with you. THERE ARE VALID AND LEGAL USES
for a ham transmitter to a non-ham. How about Civil Air Patrol? They use
frequencies which are just outside of Amatuer bands, and DO NOT REQUIRE a
ham license to transmit on their frequencies....I know...I'm in CAP. I am
LEGALLY able to transmit on a "ham" radio ON CERTAIN FREQUENCIES, even
though I'm still waiting for my ham license (just passed the tests....I'll
get a Technician license for starters).

How about Civil Defense? I'll bet they have their own frequencies too...
How about MARS...bet they have theirs, too.

Sure, it's not within the ham radio bands, but you can STILL use a ham
radio to reach these valid frequencies. I use my 2-meter....also can
use my HF radio for CAP frequencies.

****

THE LARGEST HAM RADIO AND ELECTRONICS
FLEA MARKET IN NEW ENGLAND
OCTOBER 6-7 1989

The fall edition of the HOSS TRADERS ham radio and electronics
flea market will be held Saturday OCTOBER 7 starting at DAWN at the
DEERFIELD FAIR GROUNDS, DEERFIELD N.H. The fair grounds are located on
RT-43, a few miles off of RT-101. RT-101 is directly accessible from RT-93
in New Hampshire. Talk-in is available on 147.00 (rpt) and 146.52.

The spring edition of this flea was the best ever with some estimated
of as many as 8000 people attending ! There is plenty of food, and parking
available.

For REAL hams, the flea market actually begins FRIDAY at about NOON and
continues into the night. Bring a flashlight, a smooth and phillips screw
driver and a jacket. (HINT: the best deals go down on friday !!). Camping
is available.

Admission is $5.00. ALL PROFITS go to the Shriners CHILDRENS BURN CENTER
in BOSTON. There is NO additional fee for sellers. Now is the time to
clean out the old ham shack !!

I'm buying a Futaba 4NBL radio (which only ships with 72 Mhz crystals and alignment) and I'm thinking about realigning the rec/trans for 6M. I've ordered the schematics from Futaba, does anyone out there have experience doing this? Specifically: am I crazy? will I spend more on random components for the transmitter and receiver front end then the difference in cost between the 4NBL and the radio which (literally) cost twice as much but is available on 6M?

I have sent a reply directly to Mr. Hendrickson, detailing my opinion of his posting. I will not clutter the net with such things, because I don't want to see any flame-wars breaking out. So, to prevent any further confusion, I wanted to clarify my statements: I did not mean by any way to imply that DX was limited to HF, I know that VHF/UHF/SHF is more than capable of good distances, and I did obtain my advanced license after studying and working at it (and made a 98% even though I had the flu and a 101degree fever).

My PERSONAL experience with VHF, due to my own budget and equipment limitations, has been FM 2meter equipment, using packet and FM voice on the local repeaters. NOW, I have a very capable HF rig and have already contacted Australia, Russia, and a few other countries, and have the means and interest in working DX. Thus my original question, for additional information regarding radio propagation outside of that contained within the Study guides for the VE exams and what is contained in the ARRL Handbook.

Anyone who could be of assistance, please e-mail directly. Anyone who has objections or "flames" about how they interpreted my question, read the above two paragraphs; if you still have objections, e-mail directly... I have no interest in starting another "CQ Pizza" or other hot top of controversy to clutter up the net. Thanks.

2596. Re: Radio Wave Propagation

Newsgroup: rec.ham-radio
Date: 1989-09-12 16:09:00 UTC
From: CSMSCST@OAC.UCLA.EDU
Message-ID: <8909130706.AA15338@ucbvax.Berkeley.EDU>
Source record: 16938

A good book which is readily available is "The Shortwave Propagation Handbook" by Jacobs and Cohen, published by CQ. For a more mathematical treatment, see "Ionspheric Radio Propagation; NBS Monograph 80" by Davies. Your engineering library should have it. ("Monograph" is misleading -- it's 470 pages.)

The August issue of QST has an article on the NBS BBS operating from Boulder which makes available detailed propagation information. There is a wealth of information in the help files there.

I also recommend getting a copy of MINIPROP (a PC program) from W6EL, a well-known DXer and propagation expert. You may find a earlier public domain version free on some BBS. The current v3 version is available from Sheldon for $50. One caution is that you need either a lot of patience or a floating point chip (coprocessor). A typical full run (7 freqs) takes 2200 seconds on a base PC-XT, 90 seconds on the same machine with a 8087, and about 15 secs on a top-end PS2-70. Note that this program is far more sophesticated that most of the other "toy" PC propagation pgms around.

All of the above contain references which will point you to further reading.

Please excuse the rude person who answered your posting with an insult. There is a small minority of people who seem to think the purpose of this forum is to see who can generate the most abuse, and who are under the further dilusion that other people are interested in reading their garbage. Fortunately, most of the readership is smarter than that.

>
>Dewey Paciaffi

Nope. It ain't true. You don't need a license at all to run a Carrier
Current station! (AM broadcast only. It won't work on the FM band.)

Carrier current falls under FCC Part 15 rules for unlicensed
transmission. You use the power line as an antenna and it's legal so
long as you can't be heard more than a few meters frm the nearest wire.
Common applications are school dorms (college radio), tunnels and
roadway warning systems.

LPB Corp. in Pa. was/is a major manufacturer of this equipment. About
17 years ago I bought a bunch of their stuff for my college station.
All tube, of course, in those days. They had a 5 watt and a 40(?) watt
AM transmitter. The bigger one covered a cluster of buildings and the
little one did a building or two. LPB also supplied special matching
transformers to feed the power lines with.

>would dearly like to just use the new TV without a converter box
>and its associated remote. My cable company are a bundle of fun
>they say I have to get another box just like the existing one
>which kind of defeats the object of getting a cable ready TV.
>
The term "CABLE-READY" refers to the ability of the TV to
properly receive the cable-based channels (different from those
broadcast). Whereas the ability to "descramble" is another
distinct capability. I believe the reason the cable company is
recommending the 2nd box is to received AND DESCRAMBLE. Cable-
ready TV's are a great benefit, but more so for those folks who
DON'T WANT TO RECEIVE the so-called "premium" (read- scrambled)
channels.

>The TV itself receives all the cable channels fine, but off course
>the scrambled channels are scrambled. Does any one know if it is

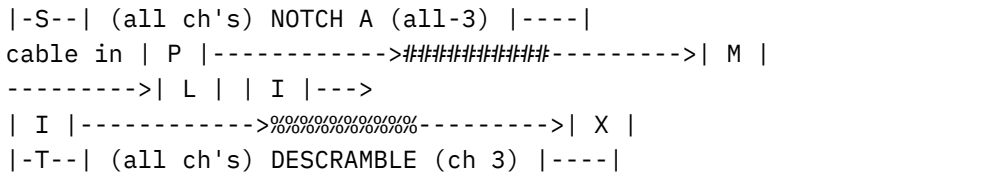
> ----%%%%%%%%%----
> DESCRAMBLE
>
>Where NOTCH A filters out the chosen 'premium' channel, NOTCH B
>filters everything but the chosen channel.

>
> Another possibility (perhaps simpler) looks like this:



Where the splitter and mixer are your standard, run-of-mill
UHF/VHF splitter (Radio Shack or ?), and the descrambler is the
cable company's box (set to the premium channel you want). The
NOTCH A filter would remove only channel 3. Of course, if your
cable is broadcasting a "normal" channel 3 (ie not premium), then
it would be lost with this setup.

>I know this looks like an effort, but I would like to avoid too
>many remotes and reduce the clutter of visible boxes. I appreciate
>I could buy a learning remote and get what the cable company
>recommends, but if that is the only solution I might just as well
>have bought a less expensive non-remote not cable-ready TV.
>
I'm confused as to your dismay at buying a cable-ready TV when
it does help to eliminate the need for a cable-company box. With
a cable-ready TV you only need the cable-company box IF you
intend to watch premium channels.

I'm certain that there are RF (TV frequencies) NOTCH FILTERS out
there, but you may have to contact one of the more comprehensive
electronic supply firms to locate one. Look in the yellow pages
and make a few phone calls.

>Please email any thoughts/advice, and thanx for any help.

Phil forwarded to me a question someone asked about how these pictures were produced. Unfortunately the posting in which the question appeared has not arrived here, so I will follow up to the original posting.

Note, incidentally, that the pictures are not from GEOS, they are primarily from the NOAA TIROS-N satellites.

The equipment used to produce these pictures is as follows:

- Dressler ARA-800 active antenna
- Kenwood R-5000 with internal VC-20 VHF converter
- A&A Engineering WEFAX demodulators
- PC/AT clone
- My own software to produce the raw data
- FBM to produce the GIF images

The R-5000 unfortunately does not have adequate bandwidth for the satellite pictures, which is the reason for the snow in some of the whitest and blackest portions of the picture.

^^^^^^^^^^^

Uh ... wasn't the original thread based on transceivers ????
It would seem to me that I should be able to buy one (in fact I own a
IC735) and use the receiver only (until I am approp. licensed)

I think <insert name here> ought to be able to buy a car (any car) if
it is going to be used in a legal manner (not just be limited in capability
to only operate in a legal manner)

Phil's own arguments seem to be in favor of anyone buying a transciever
until the portion about transmitting capability was mentioned.

Does anyone know where one can obtain a working cartridge
or disk-based version of Dr. DX for the Commodore 64?

I'm posting this for my son; please respond to him at
calhoun@auducvax.bitnet or calhoun@ducvax.auburn.edu
or to me if necessary.

If you are blessed to be reading these discussions as a Usenet
newsgroup and have the 'rn' newsreader, you should know that the KILL
function allows you to eliminate discussions and authors that you don't like.

To eliminate a discussion thread, simply type 'K' (an uppercase letter)
whilst reading one such message. From then on, messages with the same
Subject: line will be discarded from your reading list.

To eliminate an obnoxious author such as myself, do as above and then enter
Control-K. This will allow you to edit the kill file. Change the last
line in the file to read something like
/phil@ux1.cso.uiuc.edu/h:j
which will then discard all articles which have the string between the
slashes in the header of the article.

Other newsreaders may have similar capabilities. Some mail handling
systems do to, if you're receiving this as individual messages.

Peace and quiet reigns again.
- Brian

>Well looking at everything available, I am convinced that the DISCONE
>provides the best coverage (albeit at unity gain), and talking to people
>that use them, everyone I know that has one is happy with it.
>
>Hence, a request to the NET. Has anyone ever built a DISCONE antenna? Is
>there an article or project anywhere with instructions?

See _The_ARRL_Antenna_Book_ starting on page 9-7. I have built several
and they work quite well. The specs for a discone are a little misleading
though. I thought that the unity gain would give me about the same
performance as a 1/4 wave cut for a specific frequency. I actually
got better performance though because the discone appears to have
a much lower angle of radiation that the 1/4 wave.

If you are able to build one that won't be torn apart by wind and
weather, let me know. I'd like to see your plans. I use mine
mostly in the attic.

I wouldn't necessarily agree with the characterizations made of the publications discussed in recent postings --> in fact, I find that the articles published in Popular Communications and Monitoring Times are often timely and very interesting.

If you find that the advertisements are capturing your focus more so than the content of the magazine, I'd suggest that you drop a line to the Editor. In my experience, actions along those lines draw a good response - try it!!

Incidentally, if you are finding that the advertisements are meeting a need - I'd suggest that the magazine *is* worth your while!!

Best!

Well, speaking as someone who FINALLY, after many years of being on the sidelines of Ham Radio, and really WANTING to be a ham (I'm up to about 3-5 WPM now and was just about ready to go for my Novice, read on...):

This, the "CQ Pizza" discussion and the business about the SKYWARN nets (all of which, in some small way, relate to why I finally took the time and effort to learn code) have turned me off so throughly that I honestly doubt I'll EVER bother going the rest of the way and actually getting my license. Since one of the reasons I was going to get my license was to be able to chat with a friend who frequents the MM net, I see no reason (and I've been listening to some of the GARBAGE on 20 lately) to put out the effort (and money and time) to get licensed, set up a station, just to be abused by some of the JERKS, who think, because they've ALSO learned code, and have been "in the ranks" for more than a few years, that THEY ALONE have some sort of magic connection to the FCC and that THEY ALONE can "enforce" THEIR TWISTED views of the rules.

In some ways, it strikes me as funny, the BOZOS running the QRM and dropping repeaters on calls they don't like are probably the same ones who can't figure out why Ham Radio is dying.

Well, catch a clue, guys.............

Someone send me mail if/when things change and/or the FCC takes your toys away.

Clay Jackson

(Seriously, if someone, ANYONE, can convince me that there really are more "good guys" than "bad guys" in Ham radio, I'll listen. But, I ALSO listen to 20M and I sure don't hear it there).

2610. SX-38s, Discones and Selling to the unlicensed

Newsgroup: rec.ham-radio

1. I bought bought a very clean little SX-38 at the last swap; it's s
my table smiling at me now. Can someone copy a manual for me? (Costs will
be compensated, of course)

2. Discones are easy to make; see the ARRL Antenna Manual. They are
pretty non-critical, too. Typical specs are to make the disk about
a quarter wave in radious at the lowest frequency of interest and
the cone about 3/8-3/4 wave. Me, I boought the RS model. Very well
made; all stainless. I would suggest adding a spike to the top (there's
already a bolt there, so it's easy) to improve coverage below 2m.'

3. Selling to the unlicensed: No problem. I've got as pair of cable
cutters and, for the worst offenders and interlopers, a surplus HARM
missile. Not worth the bandwidth it's been given, honestly. I
have more of a problem with the licensed lids around here...:)

o 220 Refusal: FCC's Bitter Pill for Ham Radio

"Comments filed by individual amateurs were of little value for determining statistics on overall use of the band. ...In most instances, individual amateurs gave no indication of whether they actually use the 220-225 MHz band themselves. Further, most of the comments that did indicate use of the band were vague. ...We are unpersuaded by the petitions for reconsideration to make any change to the decision." - FCC

The Amateur Radio community has known for months that the FCC would deny amateurs' petitions for reconsideration of its Docket 87-14 reallocation of 220-222 MHz to the land mobile services. lthough the Commission voted the item June 15, the official action actually took place August 17 when the agency released the full text of its decision. Only now do we get to see the full FCC response to the many petitions. The text contains few surprises and little, if anything, to raise the spirits of hams concerned about the loss of this valuable portion of spectrum, even thought the amateur service was made the primary user of 222-225 MHz.

The commercial land mbile radio industry insisted that the 2 MHz is badly needed to provide for explosive growth in the mobile services. The FCC agreed, and maintained that the band is needed as an experimental test-bed for new, narrowband radio technologies.

The primary narrowband technology under consideration for 220-222 is Amplitude Companded Single Sideband (ACSSB), a processed version of the familiar AM SSB - an analog mode. ACSSB has been available for years but was never widely used because it is hard to "shoehorn" it in between existing FM channels and because Motorola, the dominant manufacturer, has not marketed ACSSB radios in the U.S.

ACSSB is used in dedicated spectrum in England, but it is today attracting relatively little interest or funding from manufacturers or researchers around the world. The cellular telephone industry expressly rejected ACSSB for its next generation products, favoring digital voice technology instead. Nevertheless, United Parcel Service, a major beneficiary of the reallocation, will apparently use ACSSB in its multimillion-dollar UPSnet system for vehicle and package location.

Throughout Docket 87-14, amateurs argued that 220-222 is essential for packet radio, for emergency communications and for control operations. Amateurs pointed to alleged procedural irregularities, including the FCC's acceptance of very late filed comments by UPS in support of the reallocation.

Some amateurs threatened to not comply with the FCC's request to get out of the band in an "orderly" procss. Allegations of corruption in handling of the case were made, but never proven. A subcommittee of the House Government Operations Committee convened a hearing on

the FCC's handling of the matter which we covered in a previous issue. The subcommittee did not officially condemn the FCC action, but the subcommittee chairman did point out several alternatives he thought the FCC should have considered. The FCC seems to have grudgingly agreed to consider one of the alternatives: a secondary aateur allocation at 216-220 MHz.

Amateurs filed approximately 700 petitions for reconsideration of the FCC action. Many of them merely repeated previous arguments and/or were filed late, and thus did not comply with FCC requirements. Of the 700 petitions, about 525 came were filed by Californians. About 40 petitions came from amateurs in Nevada and Arizona. Between 20 and 30 petitions were filed by amateurs in Florida and Missouri. No other state had more than a dozen amateur peititons, and in spite of the "Save 220" campaign, no petitions were filed by amateurs in 26 states. A large number of filings came to CC by way of Congressional offices.

Here are FCC responses to some of the issues raised by the amateurs (along with some comments of our own).

Need for Narrowband Technology

The FCC stated that the petitions for reconsideration argued that "narrowband technologies will not be necessary to meet future requirements." Our review did not reveal many petitions that made such a claim.

The FCC noted that narrowband is not the only spectrum efficient technlogy that might be used: "In fact, the Commission is providing for other spectrum efficient technology such as trunking and digitial as suggested by the ARRL." This FCC comment may be somewhat illusory. Trunking (automated channel selection) is used in 800 MHz dispatch mobile radios. It does increase spectrum efficiency. However, the FCC is only taking comments on expanding its use into other bands.

The agency is not really promoting the wider use of trunking at this time, particularly since radical changes in allations and structure may be necessary to use it below 800 MHz - changes that may never come about for political as well as technical reasons. Trunking of FM stations as a means of spectrum efficiency has been left behind in favor of digital voice in most of the recent research.

The FCC's claim that it is providing for digital may not ring completely true. The FCC seems to have done little to promote the use of digital voice in private mobile radio in spite of it potential for very high levels of efficiency. In fact, the FCC denited a petition that inquired into a planned conversion of private mobile spectrum over to new technolgoies such a digital.

Digital voice is now mostly used for scrambling police conversations. The cellular phone industry will switch to digital voice over the

next few years, but that will not have much direct effect on private mobile radio which is still mostly FM. The private mobile indusry is expected to clamor for additional spectrum allocations for the foreseeable fuure.

Spectrum Alternatives:

The ARRL and many individual commenters urged the FCC to look at other bands, notably 30-50 MHz, as an alternative to 220-222 MHz for the UPS and other commercial systems. The FCC said that "such reallotments (of spectrum) would entail severe costs to a large number of users as well as potentially having a detrimental impact on safety services such as the police and fire service."

In practice, these "low-band" commercial and public-safety users have been voluntarily migrating out of 30-50 MHz and up to 450 and 800 MHz as radios for those bands became available. There's been no forced reallotment.

Continuing on the same tack, the FCC said "An examination of the Commission's license data base for the 30-50 MHz band reveals that there are no unused equencies." However, the FCC's data base doesn't show whether frequencies are used. It reveals only whether licenses exist -- many of which may have been left in the computer when licensees have consolidated their operations in higher bands.

Repeater Directory:

An often-repeated argument by ARRL and individual petitioners was that the FCC improperly used the League's Repeater Directory to determine 220 use. The FCC found little help in comments on this subject filed by amateurs, as shown in the quote that opens this article.

The Commission said, "In the almost 700 petitions for reconsideration, only two provided information on unlisted repeaters. The Oregon Region Relay Council Inc. and the Portland Amateur Radio Club Inc. state that there are only 8 repeater listings in the Repeater Directory for Oregon, but their data base shows 15 coordinated repeaters in the state. They content that the Repeater Directory is in error by a similar percentage throughout th United States. There is no evidence to support this hypothesis."

The FCC noted that the band plan lists 54 repeater pairs at 222-225 MHz. "Therefore, all of Oregon's repeaters could have their own assigned pair of frequencies, with 39 channel pairs still vacant for new repeater operations. Another 42 unpaired channels would still be available for operations such as control links and packet radio."

Monitoring of amateur use of the band by the FCC, as some suggested, "would be irrelevant," the Commission said. "No party has argued that the 220-225 MHz band is congested in terms of the communications traffic carried in the band. ...[We] have assumed that every

transmitter listed by the amateurs is fully used. We would not expect this to be the case in practice. Thus, if anything, monitoring would be expected to show less use than we have assumed."

Reaccomodation:

The FCC continues to believe that operations from 220-222 can be moved into 222-225 MHz. "[In] most states the number of repeaers listed do not approach the number of channels in the 222-225 MHz band." In urban areas, the FCC said "more efficient use of the spectrum will have to be made."

The Commission said hams could accomplish this by better planning, reducing power to increase frequency reuse, and by greater sharing of channels. The FCC said that more efficient spectrum use will be particularly needed in California, and that it may require "some amateur repeater operations to time-share channels within the same geographic area."

Many petitions mentioned the Condor repeater network, which runs through California ...and parts of Nevada and Arizona. Amateurs said this network was needed for emergency communications such as in earthquakes. The FCC said "We do not believe that the system's existence is threatened" ...because it only uses one frequency in 220-222 MHz that will have to be moved. "Further, we note that in Southern California, it may be necessary to begin moving some operations to higher frequency bands such as the 902-928 MHz band." The vast majority of operations in 220-222 can be reaccommodated in 222-225 MHz "at little or no cost and with little or no loss of air ime."

In a footnote, however, the FCC said "In its Petition for Reconsideration, the ARRL suggests that the Commission might have considered a secondary allocation in the 216-220 MHz band as replacement spectrum for displaced amateur users at 220-222 MHz. No such allocation was proposed or raised by the commenters in this proceeding. ARRL may, if it so chooses, submit a petition making a specific proposal. The petition would need to provide support for why an allocation is needed and show how amateur operations could use thisaand without causing interference to existing users of this spectrum or to adjacent TV channel 13 operations in the 210-216 MHz band."

We now know that the ARRL Board has directed League counsel, Chris Imlay/N3AKD, to file such a petition. We expect the broadcasting establishment to try to defeat any secondary allocation for Amateur Radio at 216-220 Mhz.

More on 902-928:

"We believe the 902-928 MHz band provides a significant opportunity for the growth of packet radio. Amteur literature indicates this band is little used. ...While some amateurs argue that propagation

characteristics make use of the 902-928 MHz band impractical, we note that fixed services in the 928 MHz and 956 MHz bands transmit data over distances of 30 miles."

"Some amateurs argue that the 915 MHz band is unsuitable because no commercial equipment is available. We do not find this a compelling argument in that if there is demand for equipment to operate on this band, manufacturers can be expected to produce that equipment. ...One of the purposes of the amateur service is to learn about radio and this process is facilitated through construction of equipment."

UPS Comments:

"Amateur interests claim that prior to the acceptance of these [UPS] comments, there was no serious support by the land mobile community for the proposal. The ARRL asserts that acceptance of the UPS comments was a desparate attempt by the Commission's staff to show support for the proposal and was indicative that the outcome of the prceeding was predetermined.

"UPS had provided information on possible use of the proposed land mobile band for data networks. This was new information that could not have been presented within the original comment period. This action is provided for in the Commission's rules."

Sense of the Congress Resolution:

ARRL lobbyists succeeded in their campaign to obtain a Congressional resolution supporting Amateur Radio. The FCC believes that the resolution does not require it to hold oral arguments, as the League had requested, in order to better explore the amateur position. The FCC said that is "re-evaluation of the issues" (which produced the same result as the original evaluation) "adequately responds to both the letter and the intent of the Congressional mandate."

The remainder of the decision addresses a request by TV Answer Inc. to receive a 220 MHz frequency for its device that transmits TV viewer information from the set back to a cable company. The FCC said that it would not grant TV Answer a frequency in the 220-222 Mhz, but that it will examine an allocation "below 220 MHz" in a separate proceeding.

When Do We Move?

The FCC is a long way from setting a date by which amateurs will have to move out of 220-222 MHz and UPS and its ilk will get to move in. The Commission has not even released any proposed rules for the band; a UPS petition to do so is still pending. After the FCC does release proposed rules sometime this year, we expect at least another year will pass while the FCC decides what to do to create a bandplan and industry structure for the new frequencies. Undoubtedly, this period will see a lot of mobile industry representatives knocking on FCC doors.

Because so many issues will be involved, a Further Notice of Proposed Rulemaking could be likely - taking another year. Once rules are finalized, some party or parties will probably petition for reconsideration. Once those petitions are dealt with - it could be many months - the FCC would have to begin accepting license applications. If cellular telephone and other new services are any example, entrepreneurs and speculators will bog down the FCC with thousands of applications for processing. A lottery procedure could be used to grant licenses, but lotteries are typically performed on an area-by-area basis over a period of time.

Of course, this scenario assumes that the ARRL court appeals will be unsuccessful. If they are successful, an even longer period may ensue to sort out the issues.

Sometime during this lengthy process, the FCC will announce the date and time by which all 220-222 amateur transmissions must cease.

Don't hold your breath.

[End this issue]

::::::::::::::::::::::::::::::::::
:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2059--Sept. 5, 1989 ::
::::::::::::::::::::::::::::::::::
```

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Ingemar Sandberg.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2059

SATELLITE-TV--Sweden's Board for Psychological Defence wants to study how war can be waged psychologically, by way of satellite television. Previously, the board has monitored international radio broadcasts. Now it wants to study the effect television broadcasts from abroad, and has asked the government for funds for the project. (TT)

Meanwhile, one such television satellite, Astra now claims that more than 10 million European households can see its programs. Astra has 16 channels, of which about half are currently in use. Of those 10 million households, nearly 4 and a half million are in Belgium and the Netherlands, while nearly 2 million are in Scandinavia. Only 300,000 households in Britain can watch the Astra channels. As we mentioned last week, that's bad news for Rupert Murdoch's several Sky channels on Astra. ("Elektronikvaerlden")

SATELLITE IONOSPHERIC MIRRORS--The increase in satellite broadcasting has had an interesting new effect on radio propagation. An engineer working at home has discovered a way to beam TV and other signals over the horizon, taking advantage of satellite television uplinks.

Engineer Anthony Hopwood discovered that the ionosphere over a satellite television uplink becomes heavily ionised. That means that signals can be bounced off the ionized layer. Since the locations of the satellite transmitters are known, the paths of such bounced signals can be worked out. For example, television stations in a large city could use these man-made mirrors to beam signals to a local audience outside the usual line-of-sight coverage area.

There's a security aspect as well. The mirror effect could also be used to eavesdrop on signals going up from the ground to satellites. ("New Scientist")

BANGLA DESH--Updating SCDX-2054, the external service of Radio Bangla Desh in English to Europe between 18:15 and 19:00 now is back on 11515 kHz with 7520 kHz in parallel. (Edwin Southwell, England and Gerard McGuinness, Ireland)

CANADA--Radio Canada International is no longer using 15440 but only 11955 kHz during the English broadcast to India and the Middle East at 13:00. (Satish Bhatia, India)

CHILE--The country suffers from lack of electrical energy due to an unusual dry winter season. Voltage is down to around 200 Volts so some sensitive electrical equipment such as computers does not function. Energy has to be saved so TV stations such ast(TV Universidad de Chile and TV Nacional have ceased broadcasting on weekends and during weekdays transmission times are shortened. Radio stations usually broadcast only during daytime. Some FM stations have decreased power voluntarily, others close earlier in the evening. Only one of the stations broadcasting 24 hours a day - "Dia y Noche" located in Temuco in southern Chile - continues with usual programming. The shortwave and FM broadcasting of the Chilean national network is said to be affected as well but no change in programming has been noticed so far. (Markus Brinker, Chile)

ECUADOR--Radio Nacional del Ecuador broadcasts via the transmitters of HCJB in Spanish to North and South America on 15270 kHz 17:30-18:00 hrs. HCJB verifies reception reports to Radio Nacional with a QSL card. (V. Neelakandan, India)

FRANCE/GABON--Radio France International has been heard on 3305 kHz 19:00-21:00 hrs. This transmission is believed to be from Gabon. (BBC Monitoring)

HUNGARY--According to a spokesman for Radio Budapest, broadcasts in French will start as soon as the station finds a Hungarian journalist who speaks the language. (Robert Chear, France)

ICELAND--Here is the new short wave schedule from Rikisutvarpid, the Icelandic state broadcasting service: to Europe at 12:15-12:45 on 13745, 13790, 15767 and 15780 kHz and at 18:55-19:30 on 9268, 13830, 13855, 15767 and 15780 kHz. To North America 14:10-14:40 on 13790, 13855 and 15767 kHz, at 19:35-20:10 on 15767, 15780 and 17440 kHz and at 23:00-23:35 on 13855, 15767 and 15780 kHz. (Bernd Trutenau, West Germany)

INDIA--The "Central Monitoring Services", which keeps track of broadcasts to India from other countries, is planning to set up units in Tamil Nadu for monitoring radio and TV broadcasts from neighboring countries, paticularly Sri Lanka. The "Central Monitoring Services" was set up in 1939 and operated from Shimla, but it has not been very active in recent years. After being moved to Delhi, efforts have been made to reactivate the organization. ("Indian Express" via Vidjit Vijaysanker, India)

Updating SCDX-2051 and 2053, due to the introduction of the special broadcasts by the Sri Lanka Broadcasting Corporation in the Tamil language to India, All India Radio has begun a "Special Foreign Service" to Sri Lanka in Tamil from the Trichur station on 936 kHz. Transmisions are 11:00-12:00 hrs followed at 12:00 by programs for the Indian peace keeping force in Sri Lanka. Another

broadcast in Tamil to Sri Lanka is at 08:00-08:30 on the same frequency. (S.C. Tamizharasu, India)

The national program of All India Radio is transmitting to the Delhi area on new 1215 kHz. (G.R. Nagaraj and Bhupinder Juneja, India) BBC Monitoring reports the additional channel for Delhi as 1251 kHz. Sign on-time is 01:40. Test transmissions from All India Radio, Vijayawada are conducted on 837 kHz with a new 100 kilowatt transmitter. Observations were made at the end of July between 18:00 and 21:45. Programs were in the Telugu language. (V. Neelakandan)

A new 50 kW short wave transmitter is under construction at Muttathhura, near Trivandrum, to provide better reception of All India Radio in northern parts of Kerala state. (Praveen Frederick, India)

JAPAN/GABON--The General Service of Radio Japan at 21:00 and 23.00 in English to Europe, Middle East and Africa uses 11765 kHz from Gabon. At 07:00 hrs 21500 kHz is used from Japan and 21690 from Gabon and at 15:00 hrs 21700 kHz from Gabon. (Edwin Southwell, England and Radio Japan)

MALTA--IBRA Radio in German at 20:30-20:45 hrs now uses 7225 kHz. (Michael Diener, GDR)

PAKISTAN--The Azad Kashmir Radio broadcast relayed by Radio Pakistan transmitters 12:00-18:00 is now on 7265 instead of 4790 kHz. (V.Neelakandan)

PHILIPPINES--The FEBC is now using 15450 kHz instead of 15465 at 00:00-02:00 (Saturdays and Sundays until 02:30). (Robin Viegas, India)

SWAZILAND--Trans World Radio has introduced a service to India at 15:35-16:30 on 15190 kHz. The first half-hour is in Urdu followed by Hindi. (V. Neelakandan)

TAIWAN--The Voice of Free China has introduced a post address in West Germany: Postfach 200553, 5300 Bonn 2, West Germany. (Andreas Kuppert, West Germany)

The WYFR relay from the Voice of Free China is now on new 11550 kHz during the English broadcast to India at 14:00-15:15. (V. Neelakandan)

TURKEY--Updating SCDX-2057, the Voice of Turkey broadcasts three times a day in English to Europe: 04:00-04:50, 20:00-20:50 and 22:00-22:50 on 9795 kHz. The 22:00 hrs broadcast also to North America on 9445 kHz, to South East Asia on 7760 and to the Middle East on 9665 kHz. (Tim Pearson, U.K. and Uwe Gruner, West Germany)

TIME SIGNAL STATIONS--WWVH, Hawaii broadcasts propagation forecasts at 45 minutes past the hour instead of 15 minutes past the hour (V. Neelakandan)

UNOFFICIAL RADIO--Increased clandestine activity in Sri Lanka has been reported during the past months. After testing in both the 7 MHz broadcast and amateur bands "The Eelam National Radio" seems to have settled on 7105 kHz. Transmissions in Tamil are at 01:30-02:15 and 10:30-11:15 daily. (V. Neelakandan)

CLUB NEWS--The annual meeting of Indian DX-er's Club will be held in Delhi between 2nd and 7th October. For further details, write to
Indian DX-er's Club, A-397, Paschim Puri, Janta Flats, Pocket One,
New Delhi-110063, India. (Bhupinder Juneja)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
03:00 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21675 kHz (East Africa)
17:00 hrs on 1179, 6065, and 9615 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

And to Asia and the Pacific:

12:30 hrs on 17705 and 21610 kHz
14:00 hrs on 17705 and 21610 kHz
01:00 hrs on 15390 and 17790 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 48 contributors this week Good Listening!

2616. Anyone need Macau (XX9)

Newsgroup: rec.ham-radio

If anyone needs macau, I will be operating from there as XX9SW
during the following periods (roughly)

9/23 1200Z until 9/24 1500Z ...rtty mostly, during the CQWW RTTY 'test

9/29 1500Z until 10/2 2300Z ... rtty, cw, and ssb

good openings to the US are from 1100Z until 1400Z on 20 meters,
and sometimes same time on 15 meters. I will generally be on the
bottom edge of the general allocations for each band/mode, also
14.200 SSB.

Hope to work you!

> more "good guys" than "bad guys" in Ham radio, I'll listen. But,
> I ALSO listen to 20M and I sure don't hear it there).

Some basic rules of ham radio....(unfortunately)

-20M is a zoo...especially on SSB....suggest you stay off SSB, use
RTTY or CW on 20, unless you like high blood pressure

-try the other bands...they really do get better....for example,
check out a 10-10 net on 10 meters, or the nets on 7.233 or 3.905
(century club, i think). Or, just grab a dx station on 10 and rag
chew (yes, some of the dx will give you more than a 59 QRZ)

-if ssb gives you high blood pressure on any band, check out cw or
rtty. I find both to be more relaxing, and have found rtty to be
very enjoyable of late.

Its tough to apologize for all the idiots on the air, but I must
admit to have heard your opinions stated by many a "new" ham who
was turned off by monitoring the band.

In article <264@trux.UUCP>, car@trux.UUCP (Chris Rende) writes:
> I've noticed more and more fast-food places using wireless mikes for
> communications with the "drive through" window.
>
> Does anyone know what frequencies they tend to use?

Marvin Hand's article, "From Drive-In to Drive-Thru," in April 15, 1988 Sound & Video Contractor magazine, describes the wireless communications systems used by the fast food industry. HM Electronics (HME) of San Diego furnishes the equipment I've seen in McDonald's restaurants, which is licensed under FCC Part 90. Order takers wear their PR-4 belt-pac COMMUNICATOR transceivers around the waste, with attached headset.

Marvin's article stated that "when a car drives up, a detector senses the presence of the vehicle and sends a message over cables to a base stations located on a wall inside the restaurant. The base station then transmits a coded tone to each of the units via radio signals."

The order take is then alerted by a tone in the headset that a customer is present. By depressing a button on the belt-pac, the order taker can greet the customer. The customer places the order, which is simultaneously transmitted to all drive-thru personnel, so food preparation can begin immediately. If there are questions about a specific order, belt-pac equipped personnel can press an internal intercom button to review the order with the order taker. The intercom mode transmits only to other workers, not the customer.

Marvin implies the NiCd batteries in the belt-pacs last for 18 hours between fast charges!

Bob Kelty's frequency list appeared in August 1988 Monitoring Times, and some of my food service frequency loggings appear in the "Commercial Communications" column of the August 1988 RCMA Newsletter.

These radios operate on business radio frequencies and require FCC licenses.

2620. Wanted- Pair of 4CX5000A's

Newsgroup: rec.ham-radio
Date: 1989-09-13 12:40:00 UTC
From: U009@CCIW.BITNET
Message-ID: <89Sep13.085235edt.57900@ugw.utcs.utoronto.ca>
Source record: 16965

Anyone out there hoarding a couple of 4CX5000A's (five THOUSAND) that they were going to build the be-all and end-all QRP station with? If the enthusiasm for the project has gone, I can find a home for the tubes. My brother-in-law runs a small particle accelerator for a local university and the tubes are getting near the end of their useful life. The new cost is substantial, as you might guess. Please E-mail me regarding desired price and/or other considerations.

Oh. Wait a minute... He's not licenced! Maybe I shouldn't be buying or selling RF stuff for him. NAAAAA... I'm his Elmer! :-)

Regards, Stu Beal, VE3MWM, (U009@CCIW.BITNET),
National Water Research Institute,
Burlington, Ontario, Canada.

2621. ATV on 420-450 (was Re: Not ANOTHER Special-Interest Newsletter)

>all of the wide band disadvantages and work any distance at all. These types
>of losses are more easily delt with in a narrow band system. There are
>plenty of 1200 MHz FM base, mobile, and HT's available commercially.
>ICOM even recently introduced a new dual bander 440 and 1200 mobile rig !

While I agree that getting FMers up on 900 and 1296 is a good idea, I maintain that 420-450 is not a good place for lots of ATV activity. There is only space for three usable channels, each of which has its problems in terms of legality or interference, below Line A, and only one channel above Line A. The higher bands offer more spectrum, a large part of which is relatively unused. It is that wide signal that causes the problems. As for propagation, I bet that the microwave types will disagree that 1200 is a problem in that area...

I'm curious: what does a high power signal on 442.1 do to an ATV transmission whose video carrier is at 439.25? How about a signal on 441.1?

There are only two ATV repeaters in the greater Houston area on 420, because that soaks up the three available channels. They share a common output on 421.25. Is this efficient spectrum usage?

]
]This, the "CQ Pizza" discussion and the business about the SKYWARN nets

Hams have traditionally been very careful about obeying the regulations
(with the notable few exceptions). The CQ Pizza and SKYWARN discussions
are an attempt to determine what is "right". Unfortunately, people
often mistake what they want to be the regs with what are really in
the regs. If you are getting into ham radio to order pizza over an
autopatch, you are definitely into it for the wrong reason - go
buy a cellular phone. If you are into it for public service
and want to participate in SKYWARN or other public service and
public safety activities, you have plenty of opportunity to work
with other motivated people in ham radio.

]license. Since one of the reasons I was going to get my license was to
]be able to chat with a friend who frequents the MM net, I see no reason
](and I've been listening to some of the GARBAGE on 20 lately) to put
]out the effort (and money and time) to get licensed, set up a station,
]just to be abused by some of the JERKS, who think, because they've ALSO
]learned code, and have been "in the ranks" for more than a few years, that
]THEY ALONE have some sort of magic connection to the FCC and that THEY ALONE
]can "enforce" THEIR TWISTED views of the rules.
]
The jerks on 14313 are the exception to the rule. Unfortunately, they
are the ones who get discussed the most. For the most part the FCC
can't stop them - it is not illegal to be impolite and to barge in
on conversations. It is merely bad manners. If you want to talk to
your friend, got to 14316, where they are more civil. You will have
no problems there.

Also please don't blame "self regulation" for the jerks on 14313. They
are not participating in self regulation, and have missed the whole
spirit. All they are doing is engaging in an immature power
trip, in the process forcing a well established net that has provided
service to many for years to move.

By the way, there have been abuses of the MM net. It really is important
for hams to keep out unlicensed folks and business communication, and
the MM folks do their best to make sure they don't provide service
for bootleggers.

As one who participates in the self regulation effort, as the OO Coordinator
for Arizona, I can say that we don't spend our time on the trivial. We
might send you a notice telling you that you have technically violated
some regulation, so you will be aware of it, but our main effort is

in helping the FCC deal with more serious violators - mostly jammers
and bootleggers. If we don't do it, much of it won't get done, since the
FCC is lacking the resources. We are not self-appointed vigilantes -
we are more like conflict arbitrators, who try first to solve a
bad situation without FCC intervention. When we do need to involve the FCC, we
are doing it under authority of the Goldwater Law, and a written
agreement between the FCC and the ARRL, and our only function is to
assist the FCC as directed by them.
]Someone send me mail if/when things change and/or the FCC takes your
]toys away.

There are 500,000 hams in the US. To denounce our whole hobby because
a few bozos (numbering less than .1%) are causing trouble is unfair.
What would you have us do? How can we get rid of these folks? For
the most part they are not violating the law or regulations, and
are simply exercising their first amendment rights. Much as we dislike
these creeps, we have to play by the rules.

2623. European Licence Conditions.

Newsgroup: rec.ham-radio
Date: 1989-09-13 14:19:32 UTC
From: Pete.Lucas.PJML@ia.nwl.ac.UK
Message-ID: <13.Sep.89.15
Source record: 16966

I sometimes get asked about reciprocal licensing in Europe: well heres
the definitive comment (transcribed from the 'Terms and Limitations' booklet
BR68 as issued by the United Kingdom Department of Trade & Industry)
+++
+++ Start of quoted material from licence conditions
+++ booklet BR68
+++
'The following additional provisions apply to licensed non-resident amateurs
temporarily visiting ans operating wireless telegraphy apparatus in the
United kingdom in accordance with CEPT recommendation T/R61-01, as enabled by
statutory instrument ("CEPT Amateurs")

1) CEPT amateurs may operate in the United kingdom under a CEPT equivalent
licence which is::
a) valid and in force
b) not temporary; and
c) Issued by an administration which:
1) has implemented CEPT recommendation T/R61-01 and
2) Permits persons licensed to use amateur stations under section 1 of
the Act to use such stations in its territory (with or without
conditions) without making application in that behalf.

2) CEPT amateurs shall transmit their home callsign after
a) the United Kingdom callsign 'G';
b) followed by the apprpriate Regional Secondary locator (if any) and
c) followed by the symbol "/"

3) Subject to this clause, CEPT amateurs shall comply with:
a) The terms of their CEPT equivalent licence, unless such compliance
would result in a breach of the requirements of the United Kingdom;
b) the terms and conditions as set out in booklet BR68 and
c) The relevant provisions of CEPT recommendation T/R61-01

4) CEPT amateurs who posess the equivalent of a CEPT class 2 licence shall use
only those frequencies above 144MHz

5) CEPT amateurs shall operate only
a) a mobile or portable station (which includes a station powered from the
mains electricity at a temporary fixed location such as an hotel) or
b) the station of an amateur licensed under the Act.
+++
+++ End of quoted material
+++
Discussion: The above means that if you are a national of a country that
has implemented CEPT recommendation T/R60-61 then you have, by implication
reciprocal permission to operate with your own callsign prefixed by 'G/'

in England, 'GW/' in Wales, 'GM/' in Scotland, 'GI/' in Northern Ireland
'GJ/' on Jersey, 'GU/' from Guernsey, 'GD/' from the Isle of Man,
conditional on your holding an appropriate licence in the first place!
Licence conditions regarding power are 'whatever you are allowed at home, as
long as it isnt more than the UK limits'. Likewise, the band restrictions
are those current to the UK, *NOT* what you would be allowed at home!
So: If you are coming to the UK from a CEPT country thats a signature to
the relevant agreement, no problem!
CEPT countries are: Austria, Belgium, Cyprus, Denmark, Finland, France
Federal Republic of Germany, Greece, Iceland, Ireland, Italy, Liechtenstein,
Luxembourg, Malta, Monaco, the Netherlands, Norway, Portugal, Republic
of San Marino, Spain, Sweden, Switzerland, Turkey, Vatican City and
Yugoslavia, but not all of these countries may have signed the relevant
agreement(s).
Meanwhile, those of you in less harmonised parts of the globe,
you will have to struggle with administrative paperwork - try contacting the

I totally agree with you!

I was the one who posted the question about the Sony "sync" growling a few weeks back. Thanks for the mention that deliberate mis-tuning seems to reduce the growling, or prevent it from starting. I had never even thought of trying that, since, to me, it seems totally wrong to mis-tune if you don't have to to avoid interference. I was brought up to zero-beat all AM signals! :-)

In any case, though, the reputed "reduction of selective fading" sure seems over-hyped for what you end up getting. In most cases, when tuning strong broadcast stations (which is what I mostly use the radio for -- tuning SW stations directed to North America), there is just about no difference in quality between using the "sync" feature or leaving it off.

Perhaps what we need to do is get an authoritative answer on just WHAT "selective fading" causes. This is what I thought was the result of that propagation defect: as you are listening to the broadcast, the signal seems to become subjectively louder, with an accompanying rise in distortion, making some words hard to understand or causing music to sound unpleasant. The signal then returns to normal.

Is this really the result of "selective fading"? If so, the Sony 2010 "sync" feature does NOT eliminate this, or even noticeably reduce it. I hear the same effect with the "sync" on or off. If this isn't the result of selective fading, of course, "sync" would not correct the problem. In that case, what difference should I be listening for? And, also, in that case what IS causing the audio distortion I described above?

To be honest, the reviews of the Sony 2010 and its "sync" feature leads one to believe that the end result of using it would be that you could listen to strong SW signals with a quality equal to local medium-wave AM. After all, the signal strength is equivalent -- the S-meter reading for SW signals is often *higher* than that for local AM stations. So the only difference left should be the effect of the ionosphere on the signal. The "sync" feature was supposed to largely negate the ill effects of the ionosphere on a strong signal. It doesn't appear to...

FT 212RH extended freq. coverage mod.

Remove the bottom and top covers and remove the front panel cover. You
must then remove the front board by carefully unpluging it (try not to
touch the lcd display). On the back of this board which is the control
unit locate jumpers 1 through 12 and unsolder any that are soldered. All
jumpers must be open (1-12 only). Reinstall the control unit and just
turn on the radio for a few seconds. now turn it off again and remove
the control unit again and solder jumpers 3, 4, 5, 11 only.

Put everything back together and apply power. The display will read 000.
Push the MHz button and rotate the main dial until 132.000 reads on the
display, then press D/MR once. Now press again the MHz button and rotate
to 180.000 and press the D/MR again.

the radio is now programmed to operate from 132 to 180 mhz. mine has tx
and rx through the entire spectrum with excellent sensitivity from 136
to 178. Dont forget that transmitting outside the amateur band is not
allowed so please consult your local athorities for a special permit.

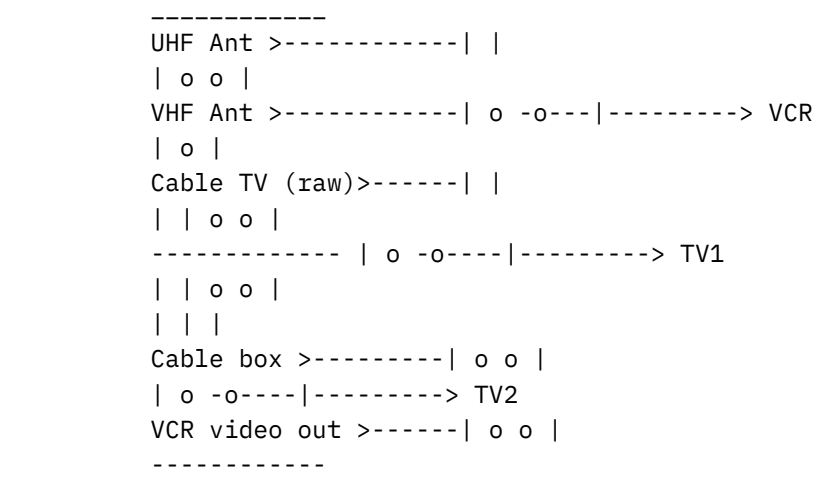
>in one end and send cable out the other with selected channels
>descrambled (off course I would only descramble those channels I
>have already paid for :-)

Go down to your favorite video retailer and buy a "video selector".
The one I have allows for upto three outputs to select from any
of five inputs. I use mine like this :

VIDEO INPUTS SOURCE SELECTOR OUTPUTS



The selector I have contains three op amps (one for each output)
that provide gain in addition to isolation from other outputs.
I am quite pleased with this arrangment since is cleaned up my
cabling mess and made it very easy to switch to the outside
antenna when the cable TV system goes down or I want to watch a
station that the cable doesn't carry.

The specific video selector I purchased was a Radio Shaft
part number 15-1264 that was on sale for half price becouse it
is being discontinued. Newer models are now available but if
your lucky, and fast, you may still be able to find the older
model.

Heard on Radio Canada International Tuesday 12 Sep 89:

CSPAN is starting an audio network for cable operators. It will carry the satellite feed audio from a number of International short wave broadcasters for their english language broadcasts destined for North America. Plans are for channel 1 to carry a compendium of many countries' broadcasts while channel 2 will be continuous BBC World Service in english.

According to the interview, all cable operators in the US have been notified/solicited for this service. If you are interested, contact the programming office at your local cable operator.

> (Seriously, if someone, ANYONE, can convince me that there really are
> more "good guys" than "bad guys" in Ham radio, I'll listen. But,
> I ALSO listen to 20M and I sure don't hear it there).

I enjoy visiting a very busy public beach -- it is a fun place to go.
Some people go there to swim. Some go to bask in the sun. Some go to
surf. Some enjoy building sand castles. For some, visiting the beach
is an affair that involves the whole family. As an added attraction,
I get to meet and talk to other people who enjoy the beach.

Lately I have noticed an unfortunate thing happening: a group of tough
looking bullies has decided to establish a certain 100 yard piece of the
beach as their "turf" and they have engaged in such activities as playing
loud music on their stereos making loud burping noises. Stereos are
permitted on this particular beach.

It didn't take long for me and my friends to get tired of this boorish
behaviour. In fact, some of my friends were so enraged that they have
sworn off going to the beach. Fortunately the beach is very long, so I
started visiting a part of the beach a mile up the road, well out of
earshot of the thugs. Now I hardly even notice the thugs because they
pretty much stick to their self-defined turf.

Cads that they are, they have as much right to use the beach as I do.
Personally, I have found them to be at most a minor nuisance. Since
they are bullies, they seem to thrive by their very nature on
confrontation. Therefore they should probably be ignored.

I have met cads at places other than the beach as well.

You might be refering to my server. It's accessed through a telnet connection to marvin.cs.buffalo.edu (128.205.32.4). The socket number is 2000. For those that aren't that familiar with telnet, the command line you'd use is probably:

telnet 128.205.32.4 2000

The server prints a little heading and has some limited help facilities. It currently allows search by call, name and city. The data used is about a year old with an update on the way. I'm also planning a number of improvements in the next month or two. Including access by mail so non-Internet people can access it as well.

Let me know if you have any problems...

I have listened as long as I could stand it (@2min) down on the dead
spectrum formerly know as 14313-kHz and can't beleive anyone down
there is even conscious that rules exist. After 21 years as a ham,
I feel the ever-feared CB syndrome has arrived. Arguing against the
no-code license is pointless, THEM are already US. I find myself
spending more and more time hiding in the CW only portions of the
band, trying to convince myself this isn't really happening. Where
are all the gentlemanly OMs that used to pervade the bands?? Lids
used to be the exception not the rule. It is with a heavy heart
that I greet these changes. Does anyone remember the Amateur's Code?

The Amateur is Considerate, He never knowingly uses the air in such
a way as to lessen the pleasure of others.

Loyal, Progressive, Friendly, *Balanced*, Patriotic??? etc.

> In some ways, it strikes me as funny, the BOZOS running the QRM and
> dropping repeaters on calls they don't like are probably the same ones
> who can't figure out why Ham Radio is dying.
We can say that the no-code license will bring in the hoardes...
BUT IMHO, the old time-tested method of getting up off one's own
posterior and getting others informed and started is the REAL way
to bolstering our ranks. This method not only brings Amateur radio
to the uninitiated, it also ensures the quality with which they
enter the ranks. ELMER used to take care of all that. My ELMER
not only gave me enough of his time to pass the test, he showed me all
of the unwritten ethics and polite operating procedures. If we take
it upon ourselves to revive ELMER, we will reap the rewards of
building the ranks with hams that are aware of the importance of
the Amateurs Code (we're not talking Morse here) and ethics in
operating. The Clay Jacksons are what we are loosing, along
with certain formerly useful radio spectrum. Clay, I don't know
about the proportions of good/evil guys in radio, but it appears

it is changing rapidly. I would be more than happy to welcome you to amateur radio, just to improve the ratio a bit. Well I have two Novice exams to prepare before Saturday, When they pass that will make me an ELMER for the 13th, and 14th time. Two more antennas to help with.....it's a dirty thankless job, but someone did it for me, and I am still greatful. Gentlemen, let us each do our part in preserving our PRIVILEGES, and bettering ham radio. Let's declare 14313 CB channel 41 and ignore it, maybe they will get bored and find something more fun to do. In the mean time, find a friend interested in ham radio and get them started. If every licensed ham brought one more into the ranks this year we would have ....

73's && 88's, de KM4JN

J. (remember the good ol' days) Herbster.

Real radios glow in the dark, & we're not talking LEDs.

2633. Mac Giffer (GIF) File Guru Needed

Newsgroup: rec.ham-radio
Date: 1989-09-13 20:16:45 UTC
From: pff@thumper.bellcore.com
Message-ID: <1716@thumper.bellcore.com>
Source record: 16946
Cross-posted to: comp.sys.mac,comp.sys.mac.programmer,comp.graphics,rec.ham-radio

Folks,

I recently FTP'd several files (pictures from a satellite of hurricane Gabrille {sp.}). All these files had a ".GIF" suffix. I have a Mac IIX. Using GIFFER (version unknown - for some reason 1.4 or 1.04 comes to mind - is that possible?). When I run GIFFER and try to open any of these files, the application laughs at me and says "Sorry Buddy, This ain't a GIF file".

Meanwhile, I faintly recall someone else mentioning somewhere on the net the all "GIF" files are created equal, except for certain editable header info. Is this true?

Bottom line:

1) What do I need to do to display these files on my Mac?
2) If I need to edit them, what's a good editor - or is any word processor acceptable;eg; MS Word 4.0?
3) What is the latest / greatest version of GIFFER and where can I get it? FTP is preferable over Compu$erve or GEnie :-).

Please e-mail your help to:
pff@thumper.bellcore.com

Best Regards,
Pete Ferris

If this is legal with a non-type-accepted radio (and it sounds like it might
be) then the non-type-accepted (for any radio service that is) transceivers
are fine to purchase. Just tell the dealer you are in CAP.

> How about Civil Defense? I'll bet they have their own frequencies too...
> How about MARS...bet they have theirs, too.

Mars requires a ham license.

> Sure, it's not within the ham radio bands, but you can STILL use a ham
> radio to reach these valid frequencies. I use my 2-meter....also can

OK OK OK

Lots of people have described lots of little problems with idea of
dealers restricting the sale of transmitters to only hams. Most of
them I still think are little, but it turns out that there are quite
a of number of them (I will not go into them all).

I AM CHANGING MY POSITION ON THE MATTER

It took a while for me to do this because I was spending so much time
holding up an asbestos shield to all the flames I got from people who
though I was suggesting a rule change (shame on you guys). Your efforts
were counterproductive.

I now believe that what dealers of amateur radio equipment SHOULD DO
(but again, I am definitely NOT suggesting this ever be a law) is to
ask purchasers of amateur transmitters for their call sign, and if
they do not have one the dealer should remind them that, except for
certain special cases like Civil Air Patrol, they will need to obtain
an amateur radio license (or be in the company of a licensed ham who
would be a control operator) to actually transmit on the ham bands.
This would apply to telephone orders. Store sales should post signs
on the equipment on display, or have salespeople check in a way similar
to the phone dealers, that the person is a ham or knows he needs to be one.

Are you satisfied now?

I'm still not going to buy ham equipment from dealers that sell (illegal)
CB linears.

I am looking for info on 2meter mutimode base/mobiles for use in packet and satellite work. Does anyone have any comments on the Kenwood TR751A? What about the kenwood TS-711A? Is an older rig (Icom IC271A, Yaseu FT790R) acceptable?

I am leaning towards the TR751, but I would like to know about any gotya's (like the display on the TM-721A).

Find another distributer. I don't know if you are dealing directly with
Futaba or not, but I know Futaba has shipped 6m radios to dealers in the
past. I have 2 of them. I suggest that you find a dealer, who will be
patient enough to go through the ordering procedure (it'll take a few
weeks) to get your business. Don't settle for anything less. Somebody
out there wants your money.

I have heard of these stations being used at colleges before the proliferation
of 88-92 MHz campus stations. They operate like the wireless intercoms
that Radio Shack and others carry. I don't know about licensing...I thought
they were license free and low power under Part 15. I believe that these
stations don't work very well past the transformer on the utility pole
outside your house. I think the old college stations were set up just
to send music through a particular dorm.

I can think of one modern technical problem with this that they didn't
have years ago....any of the filter surge supressors and gadgets for
limiting glitches on power lines are going to be another source of
attenuation for this setup.

I have some old issues of QST from World War II when hams were off the
air. There were a number of articles about things that frustrated hams
did to communicate. QST from that era had a number of carrier current
construction articles, and some of the transmitters they used ran some
real power....at least not in the mW range like the wireless intercoms.

There was a 'pirate' broadcaster in the Northeast a few years back who
tried to use carrier current to get around FCC licensing. He ran
too much power and got into trouble. I think the feds didn't like
the way that his transmissions radiated outside of the power grid.

Here in Marquette We have Hardie's as the only FF place that uses the
wireless mike.

The freqency used is 154.750 for internal communication and to talk to the
cars they use, 30.840.

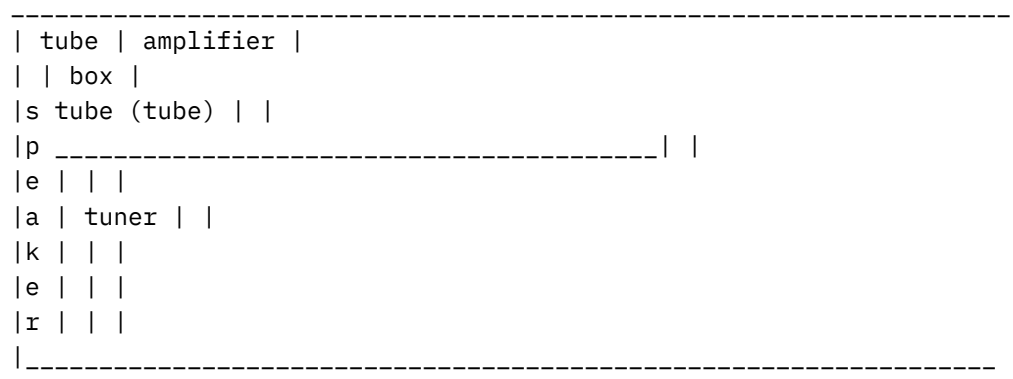
- - The original note follows - -

Hi,
it's me again.
Last semester I asked for information on te Siltronix 1011D Commance
10 and 11 meter rig. Some unnamed benefactor in Alaska at LKI Communications
(I ope I got te name rigt) sent me a potocopy of te tube layout from a
manual for te 1011C. Tis turned out to exactly matc my rig, wic I guess
is a 1011C wit 1011D labels. Well, at any rate, I lost te potocopy.
I want to tank te person wo sent me te paper. All I need is an E-mail
listing of te tubes, or really te tubes in the middle.
ere's a map. The only real problem is te tube in parentheses.
If someone can tell me it's name, that should cover the whole problem.
If someone would send me a photocopy of the tube map from a Siltronix 1011C,
tell me by E-mail at CONWAYT@WABASH and I'll send you a SASE and a greenstamp
to cover copying and inconvenience.



I think tis is only getting out on bitnet, so my address is conwayt@wabash.
Dude in Alaska, tanks. If anyone who can elp, it will
probably be you.
By the way, sorry about the 'h's. Next time I'll do this on a good terminal.

TNX in advance,

I am glad to see this situation being discussed here. I monitor the frequency about 12 hours a day (OK so I get bored here) and I agree with a lot of the comments that people have made regards the stuff going on.

It is true that the "commandos" who took over do have somewhat of a false premise. Their claim that patches are all illegal is patently wrong. They say the "new rules" forbid patches, but these are the OLD rules, and none of the patchers went to jail in the past 20 years.

BUT if the BARF boys are wrong, I think the WORST show is being made by the JAMMERS and QRM'ers. The blower noises, chicken noises, falsetto voices, and vulgar language tend to make one side with the commandos. At least they are obeying the rules. They ID, they let anyone come in and talk if they ID, and they even let the opposing view be presented. The other night, WB5LMJ read a letter he has written to QST summarizing his feelings. He was PRO MM NET, and ANTI BARF. During his transmission, EVERYONE was quiet. They politely thanked him for his opinion.

Then shortly thereafter, the noises began anew. I tuned up to 316, where the MM net now hangs out, and they had all been listening. Sounded like a put-up job to me. Everyone was saying how wonderful LMJ's comments were.

Now it has been mentioned that the QRM'ers are members of the MM and INTERCON nets, including (if one can believe the BARF BOYS) some MM NCS stations. This is bad news if true. The number of stations that refuse to ID outnumbers those that do. If I DID disagree with someone, I would say why, and I would identify my station.

It was pointed out by one of the BARF NCS stations that a huge drug bust had been made of a boat, and on that boat were three radios, all of them HAM radios, and 14313 was programmed into the HF rigs. The amount of phone patches that the MM group conducts for South American hams and certain marine stations does lead one to ponder. It would be very simple to "hide" drug running info into such patches. Seems like the MM and INTERCON nets Do make a big deal out of patches. Is it the place of ham radio to provide such a service? (Hey has BARF BRAINWASHED ME OR WHAT???)

Last night, a CW station had a repeating loop sending a QST saying the nets that were on the frequency had moved, and that "FW has lost his creditability (sic)" and gave a phoney ID that was not a call sign. (I forgot what it was, but I did write it down) This QRM went on for about 20 minutes. From the text of the CW message, one could draw the conculsion that the party sending it was indeed a member of one of the displaced nets.

I liked the beach analogy that some one made.

Truth be known, I NEVER operate on 20 meters. Once or twice a year I make a contact to insure that the equipment still works, but it is just not my idea of a good time. Of course, there are those who can not stand 75 (where I DO hang out) for their own reasons. Each to his own, I guess.

This thing on 313 has been going on for months. It will not die out soon. The FCC has been getting the calls and locations of several of the jammers though. If one can believe it, there are spectrum analysis tests being made to compare transmitter and voice characteristics.

The nut cases hit 313 like moths driven to a flame. Personally I suppose if there is one frequency that draws the majority of the flack, then the BARF BOYS have done a service to MM and INTERCON, since THEIR nets have a lot less QRM than they have had in YEARS!

*Phil howard-- <phil@ux1.cso.uiuc.edu> writes in reply:

(In reference to legal uses of amateur gear on non-amateur frequencies by users not holding a amateur license.)

*Mars requires a ham license.

Phil, this is not a flame, I just thought you and the net might be interested to know that what you said is not QUITE correct. NAVY/MARINE CORPS MARS has two groups involved. Active duty military types that actually hold a military occupational skill rating (MOS) in MARS and civilians. Civilians are required to hold a valid amateur license before they receive a MARS callsign. On the other hand, the active duty military operators are NOT required to have any kind of ham license. The bible of MARS (NTP-8 series) states that to get the MARS MOS you must either have a amateur license or have a certain amount of on the job training. I know of MANY military people that operate MARS from aboard military bases that do not have ANY kind of ham license and these include some that also actually hold the Military Occupational Skill rating.

Most radio equipment at MARS facilities IS amateur gear. In fact, a LOT of gear in use at various military establishments is amateur gear. The FCC type ratings that apply to the commercial world do not apply to the military.

I can not speak for Army or Air Force Mars.

An interesting fact is that one aircraft carrier that I was on used IC-2AT's modified to go up to 149 Mhz (this was when they were brand new on the market and you had to mod them) and a Spectrum Repeater on board the actual vessel hooked to the ships phone system. It was so successful that I believe the same system was ordered to be incorporated on all Atlantic Fleet Carriers. The story behind how it all got started is hilarious and is a BIG kudo for amateur radio.

Brian,

My name is Mark, I happen to agree with you on trying to abide by the
intent of the law, and I did not write the paragraph that you quoted
above. Phil Howard wrote what you quoted. Mike Waters supported Phil,
I was taking them both on much to the nets chagrin.

I have decided that it is fruitless to get into battles on this net even
though I was guilty of it myself. After all it really doesn't matter what
I or Phil or Mike think, we are all going to act on our own interpretations
anyway no matter what the other guys opinion is.

I swore off this topic and am ONLY posting THIS to politely correct the
quote you made. I understand how easy it is to lose track of who said what
and please excuse my posting even this message in furtherance of the "music"

issue. I just got a little "goosey" with my name attached to the above. :-)

I have been flying on 6 meters for about 6-7 years now.
I have a Kraft 7 channel radio (Kraft is out of business)
and a Futaba 7 channel radio.

I also tried building a kit.
I have learned the hard way that I want 100% reliablity with my radios.
I do not get this with kits or modifed radios.
I would recommend spending the $225-250 and getting the
Futaba radio already on 6 Meters.

I would recommend against trying to modify a 72 MHz radio for
50 Mhz.
It can be done but why risk losing an airplane on a radio.

My attempt at kit building cost me a year in learning to fly.
The kit went back to the factory 3 times and then stayed there.
I used the money to buy the Futaba which works.

I say this from 30 years of building and modifying my own ham radio equipment,
not from a lack of skills in the electronics area.

2649. windscreen aerials for motor cars

Newsgroup: rec.ham-radio
Date: 1989-09-14 12:51:48 UTC
From: fisher@minster.york.ac.UK
Message-ID: <swordfish.621780711@minster.york.ac.uk>
Source record: 16972

Apropos pjml@wallingford-nerc.ibma 's comments on windscreen aerials for motor cars, (*) I can supply a few references, in case anyone is interested. Many people seem to think that they really work.

Typical performance in the VHF broadcast band is 20 dB down on a wing-mounted whip; but if you add a simple buffer amplifier between the aerial and the cable, the overall performance is comparable to that of a front-mounted whip, and typically 6 dB better than that of a rear-mounted whip (ref. 1).

It even seems worthwhile to accept a loss of a few dB if it saves someone's eye from being poked out in an accident. Apparently this often happens if a car with a whip aerial runs over a pedestrian.

I'm not sure that I'd be happy with 25 W of RF buzzing around just behind my ears, if the aerial were to be used for transmitting, though.

When I was an operator at Army MARS station AB8AAB (Lai Khe, Vietnam) in 1970, I was the only licensed ham of the 5 operators at the station. I have no idea if the ham license was really required by Army MARS either then or now, but it is amazing how many rules can get bent in a combat zone when getting the job done is more important.

2652. Directional Coupler Question

Newsgroup: rec.ham-radio
Date: 1989-09-14 15:11:32 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <165758@Wayne-MTS>
Source record: 16973

I picked up a surplus Janel directional coupler yesterday- no data or frequency info on it, just an approximately 6"x3"x0.5" machined box with three N connectors. Reading Microwave Update '88 informs me that these things are frequency dependant, containing a 1/4 wave sampling line at the given frequency.

Question: What about lower frequencies? I'd like to use this at 440MHz, for example, and it might be, say, for 2400MHz. What's the utility of the box? My guess is that I'd only have a problem when the sampling section is some multiple of a half wave at higher frequencies and that at lower frequencies I'd just get much less sensitivity. Am I right?

Other stuff: Still looking for low cost 10Ghz sources. Anyone with a line on used Gunnplexers, Solfan microwave intrusion alarms, etc., please let me know.

Photocopies of almost any document can easily be procured and showing the
original is kind of impractical in a business that is done mostly by mail.

>and virtually undefeatable by electronics whizzes, the rigs could be
>confidently displayed and sold through just about ANY retail outlet
>imaginable.

The other major problem with this comes down to legalities again. I
don't remember the legal precedent used but I think most people (at
least people my age :-) remember the first attempt to force the use
of seat belts in cars. They put an interlock in the car that kept
the car from starting until the seatbelt was fastened. The end result
was a lot of headaches taking them back out later when it was decided
that you could legislate the wearing of seatbelts, even levy fines for
non-compliance but you could not restrict the use of a privately owned
device. I am sure because we don't have licenses for ownership, only
use, the transmitter situation would be akin to the seatbelt fight.

>
> I see the following advantages:
>
> A) More unlicensed "civilians" could buy Amateur rigs to listen
> in and gain enthusiasm to become licensed.

Equipment to "listen in" is readily available. There have always been
scanners and short-wave radios. I listened to hams for years before
I ever got a license.

> B) Manufacturers could seek more retail outlets (i.e., Sears,
> J.C. Penney, etc.) and expose their products to more people,
> thus improving public awareness, and helping lower prices
> through larger volume sales.

There was a time when ham gear was sold in retail outlets. The original
RADIO SHACK (pre TANDY), LAFAYETTE, ALLIED and yes, even SEARS used to
sell ham gear (mostly MIDLAND VHF). The main reason they don't is simple
economics. The equipment is expensive to stock, takes up space, and is
only of use to a very small percentage of the population (approx .1%).
And of this small group how many can be expected to run out and buy a new
radio every week??? How often do you buy a new radio?? The only way to
get volume sales is if the number of hams starts rising. Lets hope this

happens so more people will carry ham gear.

> C) SWLs could obtain better-quality radios for coverage of certain
> frequencies, and keep them if they subsequently chose to earn
> Amateur Radio licenses.

The current crop of SWL radios I have seen advertised and discused on this LIST are every bit as good as the receivers in our rigs. As a matter of fact most of them are made by the same companies and probably consist of the exact same circuits.

>
> The only real problem would be the outlaws (see "CB radio users") who
>would inevitably obtain used gear that was already "unlocked" and
>use them to transmit, Amateur license or not.

They would not have to buy them "used" and "unlocked". There would be a whole pile of business that would pop up to do it for them. Look around you. 150 channel CBs, bootleg satelite decoders, bootleg cable de-scramblers, where there is a market there will be providers.

>
> I suppose this would also add to the cost of designing and building
>Amateur rigs <sigh>.

There is little doubt that it would add to the cost of a hobby that is already too expensive for the majority and it is highly doubtful wether it would have any positive effect at all. Always remember, "Locks only keep honest people honest".

Subject: Re: Spending time at the beach
Re: Trey Garlough's comparison of beach bullies to 14.313.

I often wonder What things would be like now if in 1776 our forefathers had said "Well, there's nothing we can do about these british bullies. Lets ignore them and see if they go away." We would probably all talk with a funny accent and forget what an "H" sounds like. ;-)

This is the same logic that is making people in this country "prisoners in there own homes" to all the crime on the streets.

How far back into a corner do we need to be pushed before we decide enough is enough??

If we can't count on our government to provide the services we pay them for may be it's time for a change. Maybe what this country needs isn't "a good 5 cent cigar", it's a series of recall-elections.

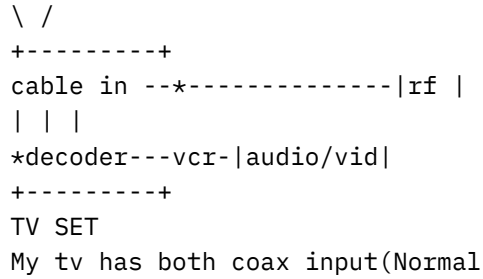
2655. CABLE READY TV

Newsgroup: rec.ham-radio
Date: 1989-09-14 15:51:00 UTC
From: MBramwel@business.uwo.CA
Message-ID: <8909141632.AA26763@julian.uwo.ca>
Source record: 16976

I have noticed the question about the cable ready tv, and not wanting to
have lots of tv remotes. This is how I setup my stereo TV with pay tv:



My tv has both coax input(Normal!) and audio/video line input. I run the
cable coax into the tv set. I have a splitter on the coax and run it into
the pay tv decoder also. The decoder plugs into my vcr which has audio/video
outputs. I plug the audio/vid into the tv, not the rf connector. The remote
on the tv allows me to select cable or aux1/aux2 for input.

The vcr is always on channel 3, therefore it picks up the decoded pay signal.
If I wanted to tape something on regular tv(never do it except for star trek!)
then I change the channel on the decoder, not on the vcr. Sitting back in
the chair, I can select between the pay channels or normal channels.

PS: The decoder has audio/vid outputs and I run them into a video sender.
It transmits the pay on uhf channel 14 and can be picked up on the bedroom set.
But thats another story......

2656. Re: Cross-Band Repeater Question

From: cb@cci632.UUCP
Message-ID: <30620@cci632.UUCP>
Source record: 17027

I'm about 200 articles behind, but I still wanted to respond to this.
I have set up my 721 as a dual band repeater. Most of the time I use
it to talk to a 440 repeater with my 2 meter hand held. I use PL on the
2m side to provide what I call controled operation. I id as:
"N2hkd on 146.52 (just an example) cross banded with n2hkd 440 repeater"

I figured that I was just using the radio as a remote base and If I id
as by the rules, that everything was OK. If I left the cross band
repeat open (which I have, and have given some old timers a heart attack
by "putting" a repeater on their simplex frequency...), then I would have to
have an id come over their just like a repeater, since now I am
in automatic control operation.
Any opinions on this?
Should I buy one/design an auto id to put in the radio?

My ID rule is when in use id, else you're not on the air....

I have been looking for an HF XCVR for doing mobile work,
I like the Icom-735, Kenwood 440 or 140, and the Yeasu 757,
but my budget is more in line with a used slightly older model.
My question is this..... which models PRECEEDED these and what
features did they have?? I primarily want a general purpose
100w rig with at least 80m thru 10m coverage. A general coverage
receiver would be a big bonus. I am not sure when GC rx became
sorta standard, but I know the Kenwood TS-430 had it. Anyone who
owns an older model and could provide me with some insight please
E-mail me. I would greatly appreciate it. I keep seeing ads
for used gear, but I have no idea what the model numbers are.
The only ones I have personally SEEN and am thus familiar with
are the Kenwood TS-430, and the Yeasu FT-707 (no GC rx).

Any knowlege appreciated.

The Radio Amateur Telecommunications Society

The Radio Amateur Telecommunications Society (RATS) and the New Jersey Institute of Technology Amateur Radio Club (NJIT ARC) are co-sponsoring the first

RATS Open System Environment Symposium (ROSES-1).

ROSES-1 is a packet forum for new users, PBBS sysops and network gurus focused on OSI or Open Systems.

There will be tech talks and roundtable discussions on many areas of packet operation as well as:

+ LICENSE EXAMS provided by the Bergen Amateur Radio Association from 8AM until 11AM.

+ Equipment and demonstrations will be conducted and literature will be available.

+ TNC tune-up clinic so bring your radio and TNC.

The date is November 11th from 8AM until 6PM in the Hazell Center on the NJIT campus in Newark, NJ. Admission and parking are free for all attending.

Talk-in will be on 145.19 (-600).

For testing information contact Pete Adely, K2MHP at 201-796-6622.

For more information including speaker requests contact Gordon Beattie, N2DSY at 201-387-8896 or via packet n2dsy@kd6th.

2661. Re: Transmitting Music for ATV

Newsgroup: rec.ham-radio
Date: 1989-09-14 23:17:29 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500199@ux1.cso.uiuc.edu>
Source record: 17034

I'm sure the FCC meant "music" being the kind you hear. The trouble is that when they wrote it, there was essentially a limited number of ways sending that "music we can hear". Today, we have many new ways. Even though the broadcasting service is not using it, PERHAPS the FCC meant that even using digital audio modes is not an exception to the music rule.

The way law works, we often have to stick to the LETTER of the law, even if it is apparently different than the original SPIRIT of the law. While the letter of the law 47 CFR 97.113(d) simply says "No station shall transmit: music;", there is still room for each of us to have individual interpretations since the definitions section does not define what music is.

My advise is to carefully consider all possibilities before taking your own interpretation into practice.

2662. Training activity: Upgrade class QSO simulation

Newsgroup: rec.ham-radio
Date: 1989-09-15 05:21:12 UTC
From: rlwest@flopn2.csc.ti.com
Message-ID: <8909150842.AA21206@ti.com>
Source record: 17036

This was originally aimed at Roger, TOBIN@EMR.Prime.com, but is generally thrown out for comments and suggestions from the net...

I go to our club shack every Thursday nite for code practice. Sometimes I get one or two folks working toward their Novice, occasionally I get a roomful of mixed background and goals. I try to provide some progress for everyone who shows up.

---

14 September 89 2130CDT...

Roger,

Just got in from code class. Mostly tonite they were Techs who want to upgrade. As an activity, I had them QSO each other, just as if they were on-the-air. Back in the olden days, that's how you got your code speed up--on the air! So, they called CQ and answered, and exchanged name, RST, QTH, etc. and if they were really brave they tried a little rag-chewing on "CW".

One guy brought his own keyer, and I have a couple of keyers and MFJ code practice oscillators (gawrsh, those things sound awful!) for the others to use.

Things that came up for discussion:
"I can't send off the top of my head!"
-- OK, write down a "script" of greeting, signal report, name, QTH, rig, occupation, whatever... I think you will find it easier to improvise as you gain confidence and polish.
"The other guy is sending too fast!"
-- Ask him to SLOW DOWN! You should SEND at the speed you want to copy. Don't be embarrassed to ask for the station to PSE QRS or send "fills." Everybody missed once in a while...
"I don't understand all the abbreviations!"
-- Neither do I. But I can usually figure them out. If not, I ask someone. Preferably the person who USED the shorthand. Check the ARRL Handbook or Operating Manual. Keep your OWN list. ASK! Remember, at 5 words per minute or so, it can take a couple of minutes to send a whole sentence. Abbreviations help shorten the turnaround time.
"I'm never going to use code! Why do I have to do this?"
-- Until (and IF) FCC approves one of the many No-Code plans under consideration, all amateur license classes have a code requirement. Period.
I think that sending enhances learning the code. You are not just writing down what you hear, but you are also putting your fingers to work. (Is that what they refer to "Neuro-linguistic programming?) The popular phrase is that you "buy into" learning the code when you practice sending. Also, you can practice sending without a key,

oscillator, computer, or anything! Just tapping on the table works!

We also spent some time just kicking around various topics, including some of the ones I see up here on INFO-HAMS. I always manage to refer them back to some relevance to the upgrade they're working on, somehow.

I've also demonstrated packet, satellite, and HF operations during the discussion segments. (I'd love to do a FSTV demo!)

Along with you, Roger, I am interested in what folks are doing out there with training, for NEW hams - Novice-Tech or upgrades, whatever. So please copy me if you will, on any replies you get!

As I told Roger at length in a direct VAXmail, I feel my best contribution to Amateur Radio is the time I spend helping others attain their licensing goal. I feel better about that than any of the hamfests, field days, S.E.T.s, walk-a-thons, traffic nets, or anything else I've participated in. I can only suggest that any ham should try it...

73,
Bob WA8YCD

2663. Discone antenna dimensions.

Newsgroup: rec.ham-radio
Date: 1989-09-15 08:50:24 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <15.Sep.89.09
Source record: 17038

Discone dimensions - I made one some years back, intended to operate
on 70, 86 and 144MHz. THe dimensions i used were as follows::

'Cone' elements: 12 elements each 55 inches long, 1/4 inch diameter.
'disc' elements: 12 elements 31 inches long, 1/4 inch diameter.

Angle between 'disc' and 'cone' components 60 degrees.

I put a 1/4 wave whip in the top (19 inches for 145MHz) as i needed to be
able to transmit through the thing. Its SWR was between 1.4 and 2.5
between 70 and 150MHz.

One bit of advice - dont use BRASS and ALUMINIUM together in an antenna!
If its in a vaguely environmentally hostile (i.e. wet!) environment,
the two metals cause an electrochemical reaction and the ali gets eaten
away to a crumbly white powder which will lead to sudden and profound
deafness of your receiver.
Even a thick layer of grease wont solve this. I tried grease, polyurthane
varnish, epoxy paint, self-amalgamating tape and all sorts of other
things, but the thing still corroded. Salt-spray, or gasses from
stoves,room-heaters etc. are not good for antennas at all!
Make the whole antenna out of brass (or brass mounts with copper tube for
the elements) and you'll be happy. Befriend your local plumber/airconditioning
supplier for offcuts. Remember that for most antennas, the ratio of
length to diameter of the elements is critical to achieving a wide
bandwidth. The fatter the elements the wider the bandwidth (usually..)

2664. UK Cellular & Cordless Telephones

Newsgroup: rec.ham-radio
Date: 1989-09-15 14:03:01 UTC
From: fisher@minster.york.ac.UK
Message-ID: <swordfish.621871383@minster.york.ac.uk>
Source record: 17050

I liked Bob Parnass's article which explained how to convert a cordless telephone into a cellular telephone (for receiving only) using a UHF TV tuner. Without wanting to detract from his article, I'd like to point out that it won't work in the UK or the rest of Europe, since the freqs. are different here. I hope the following comparison of the various telephone freqs. will be of interest to people in the U.S.A. who wonder how things are done over here. All of this info. is publicly available (sources given below).

U.S.A. U.K.

UHF TV band: ??? 470 - 854 MHz

CT1 cordless telephone,
" " mobile transmit: 49 - 50 MHz 47.44 - 47.55 MHz
" " fixed transmit: 46 - 47 MHz 1.632 - 1.792 MHz

CT2 cordless telephone: non-existent 864 - 870 MHz

VHF Radiophone,
" " mobile transmit: non-existent 158.5 - 160.0 MHz
" " fixed transmit: non-existent 163.0 - 164.5 MHz

Cellular telephone,
" " mobile transmit: 825 - 845 MHz 890 - 905 MHz
" " fixed transmit: 870 - 890 MHz 935 - 950 MHz

So, a UK UHF TV tuner will tune over the USA cellular band, but it won't tune over the UK cellular band, which is 65 MHz higher. Also, I don't know what the standard UK tuner IF is, but assuming that it's the same as the standard USA freq. of 47 MHz, that would be no good for the standard UK cordless telephone handset which receives on about 1.7 MHz.

Incidentally, having bought a CT1 cordless telephone (the only common type at the moment), I have found that I can use a standard MF broadcast receiver as a loudspeaking telephone. The base Tx freq. is at the top end of the MF broadcast band.

I feel I ought to say that listening to telephone conversations is illegal in the UK as well as in the USA. I can't see what the fascination is in eavesdropping, myself -- there are lots of more interesting things to listen to; the radio astronomy band between 150.05 - 152.00 MHz, for example. :-)

2665. IONCAP program

Newsgroup: rec.ham-radio
Date: 1989-09-15 15:12:19 UTC
From: saaf@joker.optics.rochester.edu
Message-ID: <SAAF.89Sep15111219@joker.optics.rochester.edu>
Source record: 17044

I am looking for a program called IONCAP. I learned of the program in a book called "Single Sideband Design Techniques" (or something like that) written by a group of Collins engineers. In addition to MUF plots (which can be produced by a variety of other progams, MINIMUF for example), it can produce a wealth of other information including channel reliability for different times and frequencies. There was a reference in the Collins book for a technical report that is a user's manual for the program (US Department of Commerce, National Telecommunications and Information Administration, NTIA report 83-127). I checked this out from the library this morning. It seems the program is written in FORTRAN and is available on mag tape but there is no information on the availability of the code. I suppose I will write to the NTIA and request more information, but in the meantime I thought someone on the net might have have a copy or know where one could get a copy. If so, please drop me a line. I will post any relevant information I receive.

Thanks and 73,
Len NV2Z

2666. Re: Voltage vs Current Baluns

Newsgroup: rec.ham-radio
Date: 1989-09-15 15:38:00 UTC
From: CSMSCST@OAC.UCLA.EDU
Message-ID: <8909160713.AA07377@ucbvax.Berkeley.EDU>
Source record: 17051

> I thought that a balun was a balun, electrically speaking, until I
> ...
> Q. What is the difference, if any, between voltage & current baluns?

See "Baluns: What They Do and How They Do It" by Lewallen, W7EL, in the ARRL Antenna Compendium, vol 1. It's a 5 page article. A voltage balun is essentially a transformer, while a current balun is more properly thought of as a choke. The difference between the two (in a 1:1 configuration) is the absence of a tertiary winding in a current balun. If you are using a balun to suppress feedline currents, as in feeding a dipole with coax, you want a current balun.

2667. selling gear to unlicenced persons

Newsgroup: rec.ham-radio
Date: 1989-09-15 17:39:54 UTC
From: GFWT@ALASKA.BITNET
Message-ID: <8909170708.AA10784@ucbvax.Berkeley.EDU>
Source record: 17039

I apologize for a possible faux pas: I have not been reading my INFO-HAMS as much as I should. My 1200 baud modem is FUBAR, so I am relegated in most cases to 300 BPS. The point is, that, perhaps my point has already been made.

I think that we definitely do not want to restrict the access of transmitting equipment to licensed persons only. Restricting this access will do two things: it will first make it slightly, but perhaps significantly more difficult to acquire equipment, especially by mail order. Second, it will encourage fraud, forgeries, and other shenanigans.

On top of this all... there is still plenty of used equipment out there, and anyone that REALLY wants it will still be able to get it.

What is at issue here is that we are concerned about unlicenced persons on our bands. A portion of these people are clearly scofflaws, and will always be undesirable in ham radio. But a significant number of other pirates are basically good people either too uninformed or too lazy to get a license.

I personally believe that if we give most of these people an opportunity to conform to the laws, they will. This means using some tact when talking to these unlicensed persons (I know... know communications with unlicensed stations. Too bad. get on there, tell them you know they are unlicensed, and ask them how YOU can help them get a license. Even if you get cited, you can make the argument that the conversation was in the interest of our oft-touted self-policing activities. sorry about the previous typo... the mailer doesn't have an editor in this mode) about their activities. Let them know that we would be happy to have them as a part of our community, and no matter what problems they might have in the licensing area, they are surmountable.

Jumping on pirates is bad policy, in my opinion. The fact that they have a radio tells us that they are interested. rather than making them outcasts, lets accept them, conditionally, and help them with their ticket. (That doesn't mean getting on the air with them, but it may mean a few phone calls and a few late-night coffee sessions with a code practice oscillator.)

How many of you bought a radio before you had a license? How many of you used them before your ticket came? How many of you kerchunk your repeater? The point being that, just because someone scoffs at part 97 doesn't necessarily make you a bad person. Be an ambassador of goodwill.

I know I haven't covered every scenario, but it covers a lot of them. so there!

I believe this *is* the same logic our forefathers used. In fact, our forefathers said, "Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes."

But I don't perceive any "history of repeated injuries and usurpations, all having in direct object the establishment of an absolute Tyranny over these States" on 14.313. I perceive the "troublemakers" on 14.313 as boors, not tyrants. Consequently, I am not willing to take up arms to deal with them.

Yes, roughly. From the dimensions you give it probably goes well below 1 GHz
before the coupling starts rolling off much. Generally directivity is fine
in the rolled off region.
I have used couplers well past their corner frequency (by 1-2 orders of
magnitude) with fairly good results for power measurement in the hf/vhf
ham bands. Usually the good precision and mechanical integrity required for
good higher frequency performance makes them quite useful lower down.
The only problem is in getting an accurate calibration at a number of
desired frequencies and being sure that you are making subsequent measurements
at these same frequencies. Of course if you are just measuring SWR/return loss
all you need is a calibrated detector.

>Other stuff: Still looking for low cost 10Ghz sources. Anyone with a line
>on used Gunnplexers, Solfan microwave intrusion alarms, etc., please
>let me know.

From what I hear they are pretty prevalent at the Southern California flea
markets, TRW etc. I think WB6IGP in San Diego had quite a quantity of
Solfan sources which he was making available a couple of years ago. I don't
know your usage but you may be able to use sources from radar detectors;
fuzzbuster etc...

If you have access to radio row in Tokyo- Akihabara, the ND751AAm NEC sources
are available for under $40 each if you know how to haggle. They may or may
not still be available here from Cal. Eastern Labs, NEC's US arm for things
microwave.

I'd like two recommendations for equipment (brand names, what
do you have, prices, etc.) now that I have moved into the world
of three head recorders:

A wand - type tape head demagnatizer
(I have the TDK looks-like-a-cassette demag, which is fine for the
two head machines, but it should not be used in a three head machine)

Tape head cleaning fluid that can be used for cleaning the heads
and rollers/capstans without drying out or degrading the rubber
parts.

Thanks for your help!

- - The original note follows - -

Hi, local arm of the net.
I have noticed that this net sometimes has sources for various articles
useful to hams, so I was hoping to use the net once again for my own purposes.
I have seen, in the past at hamfests, very inexpensive VHF marine band linears
with conversion kits and instructions. Unfortunately, I didn't jump on one when

I had the chance, and now that I need one more than life itself, I don't know
where to look. If anyone can E-mail me with the man's phone#, address, or even
his call, I would be eternally grateful. I think he is somewhere in Indiana.

TNX in advance.

I assume you mean machines with three fully discrete heads. The
cassette-demagnetizers are fine for 3-head machines which have the
play & record heads in a single housing. Aren't they?

I was in Air Force MARS for ten years. They made a point of saying "This ain't a funny kind of ham radio named after a candy bar." It's a military contingency network consisting primarily of military unit stations aided by selected amateur radio operators called 'affiliate members'. The only significance of the amateur license (other than morale traffic refile) is that it eliminates the need for the DoD to conduct its own qualification testing and buy the radios.

2676. Meteor scatter goes commercial

Newsgroup: rec.ham-radio
Date: 1989-09-16 06:52:29 UTC
From: winter@Apple.COM
Message-ID: <34775@apple.Apple.COM>
Source record: 17048

The current (September) issue of _Sky & Telescope_ contains a news item about some commercial communications companies that are investigating the possible use of VHF meteor scatter for "a practical and economical alternative to the use of telephones and satellites."

The somewhat sensationalistic (but perhaps tongue in cheek) opening paragraph discusses the value of such technology after phones and satellites have been destroyed by World War III. (Question: would the ionization from nuclear explosions also wipe out meteor-scatter propagation?) The more likely scenarios for such communications include the unique needs of places such as the Arctic where normal HF comms are often wiped out by geomagnetic storms.

By the way, this issue also includes Sky & Tel's annual listing of U.S. and Canadian observatories, planetaria, and astronomy clubs--including at least one club for radio astronomy.

2677. TM-731A RPTR & OUT-OF-BAND MODS

Newsgroup: rec.ham-radio
Date: 1989-09-16 16:26:00 UTC
From: VE3WZL@VE3WZL
Message-ID: <7602@VE3WZL>
Source record: 17052

Thanks to the efforts of our local technical wizard, Bob VE3GVD, we now have the secret to making the new Kenwood TM-731A do the same fancy tricks that its sister rig the TM-721A did. Here is how it's done:

1) Remove the top and bottom covers, and take out the screws that will allow the front panel assembly to swing down.

2) With the rigs front facing you and the top side up, locate R 121 and R 125 which are both immediately to the left of the lithium battery.

3) Using a low wattage iron and tweezers, remove R 121 which is about the seven o'clock position with respect to the battery and reinstall it in the blank position designated for R 125 which is about the eight-thirty position with respect to the battery.

4) Now locate R 57 on the back of the circuit board that is attached vertically to the main chassis. (It's the board behind the front panel when the panel is folded up) Carefully un-solder and lift off the grounded end.

That completes the mod. Having a service manual, or at least a board layout will assist you in locating the components. It will be neccessary to do a reset on the microprocessor as described in the user manual after doing the mods described.

For those curious as to what does what, removing R 121 enables the repeater cross-band function, and the adding of R 125/removal of R 57 enables the out-of-band features.

Source record: 17053

In searching through our library today, here at NIST, I came across the June 1989 issue of Electronics Australia, and the associated 160-page Dick Smith Electronics catalog (sort of Aussie R.S.). The interesting part was in the back of the D.S.E. catalog - a listing (accurate?) of the AM and FM broadcasting stations in VK, a listing of the 29, 53, 146, 438, and 1253 MHz ham repeaters, and the UHF/CB repeaters, etc.

Contact me directly if you want more info.

Bob, W3OTC

The bulletin has been reduced in size to allow more telemetry and WOD to
be transmitted.

Please use Bulletin ID UOSAT.271A if put on a packet radio BBS.

* MICROSAT NEWS *

All four MicroSat satellites have been tested with packet RF paths, according
to NK6K and N4HY. On September 14th, all four satellites were subjected to
thermal/vacuum chamber testing without any problems. The test "soaked" the
MicroSats at 45 degrees C. Nominal in-orbit operating temperature is intended
to be around 0 degrees C to maximize storage battery lifetime.

* OSCAR-12 SCHEDULE *

DATE MODE TIME (UTC)

26Sep JA 15:12 - 23:24
30Sep JD 21:50 - 12:44 on 10/01
06Oct JD 20:29 - 11:23 on 10/07
10Oct JA 10:42 - 18:54

* OSCAR-13 NEWS *

Peter Guelzow (DB2OS) with the assistance of ON6UG, G2BFO, and DF5DP
was able to figure out a way to shut down the Mode S beacon on OSCAR-13
during normal communications on Mode S. The Mode S transponder's beacon
was designed to shut off when the transponder operations commenced.
However, until recently this would not occur and users on Mode S had to
"push" their signals past the beacon using enormous amounts of uplink
power on 70cm. But with Peter's reprogramming of the Integrated Housekeeping
Unit (IHU) to now turn off the beacon automatically, K0RZ reports that with
normal Mode B uplink power levels it is now possible to use the Mode S
transponder. The uplink for Mode S extends from 435.471 MHz to 435.507 MHz.
The downlink is from 2400.711 MHz to 2400.747 MHz.

AO-13 Operating Schedule
16Aug89 until 16Nov89
BLON/BLAT 210/0

Mode B : MA 003 to MA 160
Mode JL: MA 160 to MA 200
Mode B : MA 200 to MA 240
OFF : MA 240 to MA 003
Mode S : MA 210 to MA 222

* MIR VISIBILITY *

The Soviet space station MIR should be visible on the east coast of the
United States for the next few weeks during the early evening hours.
If the weather is clear, make some orbital predictions and watch the flybys
of MIR!

* SpaceNews DISTRIBUTION *

Thanks to Tad, KT7H, SpaceNews is now being received by VK4ZF in Brisbane,
Austrailia! This week, a new e-mail path to Japan is being attempted.

The ARRL Letter, Volume 8, No. 18, September 8, 1989 - Part 1 of 3

Published by: The American Radio Relay League, Inc.
225 Main St.
Newington, CT 06111

Editor: Tom Hogerty, KC1J

Material from The ARRL Letter may be reproduced in whole or in part, in any form, including photoreproduction and electronic databanks, provided that credit is given to The ARRL Letter and to the American Radio Relay League, Inc.

ARRL PETITIONS FCC FOR CODELESS CLASS OF AMATEUR LICENSE

On August 31, 1989, the ARRL petitioned the FCC for a new "Commuicator" class of Amateur Radio license which does not require a demonstration of proficiency in Morse code. This new class of license, if adopted by the FCC would grant privileges on amateur frequencies above 220 MHz.

According to the League's proposal, transmitter peak envelope power (PEP) would be limited to 250 watts. Another provision of the League's proposal would be that a Communicator licensee could not be the control operator of a repeater or auxiliary station. Examinations would be administered through the Volunteer Examining Coordinator (VEC) system.

According to ARRL Executive Vice President David Sumner, K1ZZ, "It was a very difficult issue for the Board to deal with because there were strongly held views at opposite ends of the spectrum. There were a number of proposals for different things. We started out with the committee report and proceeded from there to discuss various amendments to it. There had been many other options considered informally during the preliminaries. People should be reassured that the Board gave this subject very, very deep and careful consideration."

Under the League's proposal, Communicators may upgrade to Technicians simply by passing a 5 word-per-minute code test given under the VEC system. Code examinations will continue to be required for all other classes of Amateur Radio licenses, and Morse code will continue to be an important part of ham radio.

MICROSAT TESTING SCHEDULED

The Martin-Marietta Astronautics Group (MMAG) of Denver, CO iormed AMSAT NA officials that it will donate its facilities for the testing of the four Microsat satellites scheduled to begin September 9 and finishing on September 22. AMSAT NA will have the use of a 5 foot diameter by 10 foot long thermal vacuum test chamber for five days in order to "space qualify" the Microsats.

All four of the Microsats will be mounted inside the chamber and tested in a simulated space environment, that is, in a "vacuum" and between temperatures from -20 degrees C to +55 degrees C. During the five day test, the chamber temperature will be cycled from hot to cold with 12 hour "dwells" at each of the temperature extremes.

When the thermal-vacuum testing is completed the Microsats will be taken back to the lab in Boulder for further testing and flight cable installation. They will then be returned to MMAG plant where they will undergo three-axis vibration tests. The thermal-vacuum and vibration tests are required by Arianespace before the Microsats will be allowed to fly with the SPOT 2 satellite aboard the ARIANE IV rocket in November.

This is the second time Martin-Marietta has offered the use of its test facilities to AMSAT. During the spring of '86 they provided the very same thermal-vacuum test chamber so that all the subsystems on Phase 3C could be tested.

The ARRL Letter, Volume 8, No. 18, September 8, 1989 - Part 2 of 3

NTIA TO STUDY USE OF RF SPECTRUM

The National Telecommunications and Information Administration (NTIA) says that "Commencing this fall..[they]..will undertake a comprehensive policy review of the use and management of radio spectrum in the United States." This marks the beginning of the first fundamental reexamination of spectrum policy objectives and issues since NTIA's organization in 1978.

NTIA indicates that the review is timely in light of ever increasing demands for spectrum. These demands will cause changes requiring the development and fostering of policies that will encourage the most effective, efficient and fair use of spectrum.

In the near future, NTIA intends to issue a Notice of Inquiry (NOI) to request public comment on specific economic, technical, and regulatory issues to be studies concerning US spectrum policy.

The NTIA is the Executive Branch agency principally responsible for the development and presentation of domestic and international telecommunications policy. NTIA acts as principal adviser to the President on telecommunication policy, and is directed to develop a long-range US spectrum management plan. The agency also has statutory authority to license government radio frequency use.

TENNESSEE BALLOON LAUNCH A SUCCESS

Carl Lyster (WA4ADG) and David Fields (N4HB0) report that their first balloon experiment, launched from the Knoxville, TN area on August 5 was

successful. Their first flight attempt 2 weeks earlier was scrubbed because of a faulty 5-volt regulator in the telemetry system.

This balloon carried a 2-meter beacon with a voice synthesizer reproducing Astronaut Neil Armstrong's famous words as he stepped upon the lunar surface. There was also a 10-meter beacon which sent out ASCII telemetry.

It it estimated that the balloon carried its payload to an altitude of 90,000 feet. Stations as far way as 450 miles reported hearing the beacons. After one and one-half hours of flight, the balloon burst. It took almost 30 minutes for it to parachute to Earth. A Civil Air Patrol (CAP) plane tracked its descent and kept the package in sight until the ground crew reached the 70-foot tree on which it landed.

With the success of this balloon flight, WA4ADG and N4HBO are now planning their next experiment; a 10-m to 2-m translator which they hope to launch later this year.

WB2PTI INDICTED FOR US MAIL FRAUD

According to United States Postal Inspector Martin T. Biegelman of Hicksville, NY, a Federal Grand Jury in the Eastern District of New York, indicted Michael D. Harrison, WB2PTI, of Oceanside, NY charging 50 counts of mail fraud. According to the indictment, Harrison, also known as "John McNamara," and "Mike Hanson," "did knowingly and willfully devise and intend to devise a scheme...to defraud and to obtain money by means of fraudulent pretenses...and for the purpose...did use the mails." It is stated that Harrison took out advertisements in several amateur magazines under the name of Atlas Radio, Inc and offered for sale Uniden products. The money for the orders was received, but the merchandise was neveshipped, according to the indictment.

ARRL OPPOSES BROADCASTERS IN PART 97 RECONSIDERATION PETITION

On July 20, a Petition for Reconsideration in PR Docket 88- 139 (the new Part 97 rewrite) was jointly filed by the Radio Television News Directors Association (RTNDA); the National Association of Broadcasters; American Society of Newspaper Editors; CBS, Inc.; Capital Cities/ABC, Inc.; National Broadcasting Company, Inc.; National Public Radio; Post Nwsweek Stations, Inc.; and the Reporters Committee for Freedom of the Press.

In their petition, the broadcasters assert that the Commission's newly stated rule (97.113[c]) concerning instances in which Amateur Radio operators may convey information to broadcasters for dissemination to the public is confusing and overly restrictive. Their expectation, based on FCC's Report and Order regarding the revised Part 97, was that the category of circumstances in which Amateur Radio operators may furnish informaton to broadcasters was to be broadened.

In its Opposition filing on August 21, ARRL states that the "RTNDA [et al] misunderstands what the Commission's regulatory policy is with respect to news gathering using amateur radio facilities.." News gathering was and still is prohibited absolutely. Amateurs' ability to convey information to

broadcasters..."is a narrow exception to the rules...It applies only in the most limited of circumstances [and] cannot be broadened beyond the concept of emergency communications..lest the noncommercial nature of the Amateur Radio Service be subject to compromise, and the Service exploited."

The ARRL Letter, Volume 8, No. 18, September 8, 1989 - Part 3 of 3

FOREST SERVICE FINALIZES FEE PROPOSALS FOR COMMUNICATIONS SITES

Over the past two years, QST has reported on the proposed rental fee schedules for the various radio and television services, including amateur, which rent US Forest Service land for communications sites in 6 Forest Service Regions. Originally, the Forest Service proposed fees ranging from $300-$1200 for amateur repeaters. ARRL and individual amateurs submitted comments urging little or no fees. Later proposals suggested a $75 nonwaivable yearly fee for amateur repeaters.

According to the August 23, 1989 Federal Register, the Forest Service has now finalized its fee schedule for communications uses. The fee for amateur repeater sites has been set at $75 in the 6 Forest Service Regions. According to the notice, the $75 fee represents the cost to the Forest Service for administration of the authorization and fees will not be reduced below that rate. The Forest Service Regions are: Intermountain (Nevada, Utah and parts of California, Idaho and Wyoming), Northern (Montana, North Dakota, and parts of South Dakota, and Idaho), Rocky Mountain (Colorado, Kansas, Nebraska, South Dakota and Wyoming), Pacific Southwest (California), Southern (Alabama, Arkansas, Florida, Georgia, North Carolina, South Carolina, Tennessee, Virginia, Kentucky, Louisiana, Mississippi, Texas and Puerto Rico), and Southwest Region (Arizona and New Mexico.) The effective date of the notice is September 22, 1989.

ATTENTION REPEATER OWNERS/TRUSTEES

It is now time to submit your repeater changes and updates to your frequency coordinator in order for them to be included in the 1990-91 issue of the ARRL Repeater Directory. Mark your changes on the forms provided in the back of the Repeater Directory. The frequency coordinator listing begins on page 56 of the 1989-90 edition of the Directory.

Repeater updates should be submitted directly to the coordinator for your area, however, packet and beacon changes may be sent directly to HQ.

NEW ARRL PUBLICATION AVAILABLE

ARRL HQ announces the availability of a new publication, Proceedings of the 23rd Conference of the Central States VHF Society. A collection of technical papers presented at the 23rd Central States VHF Conference, this book contains many papers covering topics of interest to amateurs operating at 50 MHz and above.

Selected titles include:

o "Performance Measurements For EME Systems" by William A. Tynan, W3XO;

o "To Build or Not to Build a Dish" by Ed Gray, W0SD and Marc Thorson, WB0TEM

o "Engineering Notes on the 23 cm Transverter" by Richar L. Campbell, KK7B

o "Amplifier Simulation Program" by Charles H. Reichert, KD9JQ

o "200 MHz SSB Activity Directory 1989" by Peter Beedlow, NN9K, and Lowell DePoy, K0LOZ

These papers are must reading for every "VHF and up" enthusiast. All papers contained in this publication are unedited and are solely the responsibility of the authors.

ARRL CONTEST ENTRIES MAY BE SUBMITTED ON DISKETTE

The ARRL Contest Branch can now accept entries for the ARRL November Sweepstakes and other ARRL sponsored contests on IBM compatible MS DOS formatted diskettes, either 5 1/4 or 3 1/2 inch.

Log information must be in a true ASCII file. The summary sheet may also be in an ASCII file, but paper summary sheets are preferred. The log file should take on the layout of the official forms containing band, date, time on off, time in UTC, number received, call of station worked, check received, section received, multipliers, report sent and points.

For additional information write or call Billy Lunt, KR1R Contest Maager, at ARRL HQ.

DON'T FORGET SEPTEMBER 16

This is a reminder that the first annual Amateur Radio Public Awareness Day will be held Saturday, September 16. Clubs and individuals will set up and operate public displays across the nation in schools, libraries, town halls, parks, fairs and anywhere else an imaginative club can think of. The event is intended to make the general public more aware of the existence, purposes and benefits of Amateur Radio. Why not join in?

2682. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-09-16 21:01:51 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8909170707.AA10702@ucbvax.Berkeley.EDU>
Source record: 17058

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

2683. Voltage vs Current Baluns

Newsgroup: rec.ham-radio
Date: 1989-09-16 21:17:50 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <166342@Wayne-MTS>
Source record: 17059

KM4UL asks about voltage vs current baluns, aka transmission line baluns. Well, to throw in my $0.02, I've been wondering the same myself. The two references I looked in were the RSGB book ("Antennas for all locations", I think) and an ARRL book on RF transformers and matching. The two authors are at odds; the first opposes current baluns and the second offers much design data, test data and an endorsement.

The argument I have heard *for" current baluns is that a voltage balun only forces voltage equal when the antenna is perfectly balanced itself, while a current balun will always force currents equal. Practically speaking, the current balun seems to be more effective and reliable as far as keeping currents from flowing on the shield as well as being simpler, less lossy in a mimatch and broader banded.

For my own use, I found that the simplest transmission line balun to build is the coax choke- just a coil in the transmission line. It does what I want it to do, which is to keep current from flowing on the shield. What it does for radiation pattern, I don't know; I've never tested it. But it works well at HF.

So much for the seat-of-pants evaluation. More educated replies are anxiously awaited :).

They memorized the exam, forgot the code, then just operate phone.

WTNT31 KMIA 162120
BULLETIN
HURRICANE HUGO ADVISORY NUMBER 24
NATIONAL WEATHER SERVICE MIAMI FL
6 PM AST SAT SEP 16 1989

...HURRICANE HUGO NEARS LEEWARD ISLANDS...

HURRICANE WARNINGS CONTINUE FROM MARTINIQUE NORTHWARD THROUGH THE LEEWARD ISLANDS AND WESTWARD THROUGH PUERTO RICO...INCLUDING THE U.S. AND BRITISH VIRGIN ISLANDS AND ST. MARTIN AND SURROUNDING ISLANDS. TROPICAL STORM WARNINGS CONTINUE FOR THE ISLAND OF ST. LUCIA.

AT 6 PM AST...2200Z...THE CENTER OF HUGO WAS LOCATED NEAR LATITUDE 16.0 NORTH...LONGITUDE 60.0 WEST...OR ABOUT 100 MILES...160 KM... EAST SOUTHEAST OF GUADELOUPE.

HUGO IS MOVING TOWARD THE WEST NORTHWEST AT 12 MPH...19 KM/HR. THIS MOTION IS EXPCECTED TO CONTINUE FOR THE NEXT DAY OR TWO...BRINGING THE CENTER OVER THE EASTERN LEEWARD ISLANDS LATE TONIGHT OR EARLY SUNDAY MORNING. TROPICAL STORM FORCE WINDS ARE NOW BEING REPORTED IN THE EASTERN MOST LEEWARD ISLANDS. ALL PREPAREDNESS ACTIVITIES IN THE WARNED AREA SHOULD BE RUSHED TO COMPLETION.

AN AIR FORCE PLANE REPORTED MAXIMUM SUSTAINED WINDS OF NEAR 140 MPH...225 KM/HR AND A MINIMUM PRESSURE OF 942 MB...27.82 INCHES. SOME CONTINUED FLUCTUATIONS IN STRENGTH ARE LIKELY. STORM FORCE WINDS EXTEND OUTWARD UP TO 150 MILES...240KM... OUTWARD UP TO 150 MILES...240KM...EAST AND 115 MILES...185KM WEST OF THE CENTER.

RAINFALL AMOUNTS OF 5 TO 10 INCHES CAN BE EXPECTED IN THE PATH OF THE HURRICANE WITH POSSIBLE LARGER AMOUNTS OVER HIGHER TERRAIN.

STORM SURGE FLOODING OF UP TO 8 FEET...2.5 METERS...ABOVE NORMAL IS LIKELY IN THE PATH OF THE HURRICANE ALONG EXPOSED COASTAL AREAS.

REPEATING THE 6 PM AST POSITION...16.0N...60.0W. MOVEMENT WEST NORTHWEST AT 12 MPH. MAX SUSTAINED WINDS 140 MPH...MINIMUM PRESSURE 942 MB.

THE NEXT ADVISORY WILL BE ISSUED BY THE NATIONAL HURRICANE CENTER AT 1030 PM AST WITH AN INTERMEDIATE ADVISORY AT 9 P.M. AST.

2686. Hugo Watch on 14.325

Newsgroup: rec.ham-radio
Date: 1989-09-17 03:36:42 UTC
From: flash@lopez.UUCP
Message-ID: <790@lopez.UUCP>
Source record: 17057

For a listen to what HAM RADIO REALLY IS about, listen to the Hurricane Watch Net on 14.325. I followed Gilbert last year over this net, and posted a running commentary on our local sytem, which was later archived and distributed as a large file called "Ham Radio Covers a Hurricane" to a few other systems. These people will renew the faith of those who have been monitoring the insanity on 313.

It is interesting that tonights NCS, PJ4CR, was interviewsd last month on Radio Netherlands Media Network. As a strange coincidence, I received a copy of this program in today's mail from a friend who tapes MN for me in Hamburg (I always forget MN, so I tape Hauser's World of Radio which is not receivable in Germany). All the ops on the Hurricane net are real pros.

Guess Hugo is really a serious blow. Guy lost his tower and is running on battery. Did not catch which island he is on. Sigs marginal this late at night.

Just when you thought ham radio had gone to the dawgs, we can be proud of those who really DO a service.

Hats off to the folks on 325!

}I'm buying a Futaba 4NBL radio (which only ships with 72 Mhz crystals and
}alignment) and I'm thinking about realigning the rec/trans for 6M. I've
}ordered the schematics from Futaba, does anyone out there have experience
}doing this? Specifically: am I crazy? will I spend more on random components
}for the transmitter and receiver front end then the difference in cost
}between the 4NBL and the radio which (literally) cost twice as much but is
}available on 6M?

Well, lacking information maybe not crazy.

Try Sheldon's in San Jose. They keep a stock of 6M R/C radios including
Futaba. I don't know if the 4NBL is in stock (phone them), but other Futaba
4CH radios have been stocked at about $10-$20 over the "deep discount"
price elsewhere. By the time all the extra charges are added I have found
the difference to be more like $5-$10.

I bought 2 5NLP radios on 6 M last year for $220 each, Sheldon's had two
each in stock of each 50Mhz channel and each 53Mhz channel.

Don't try to modify the radios though, the receiver is a BIG job to get
right, they use some very sophisticated SMT components and the whole thing
is a very compact, rugged package.

I don't have Sheldon's number at hand, but try any of the R/C magazines.

BTW 6M R/C is nice, but the gear is MUCH harder to sell is you decide R/C
is not for you and 72Mhz channel crowding is really not a big problem asny
more. You do get some freedom from the QRM/intermod problems on 72Mhz, but
with a good 1991 receiver that should be minimal.

Oh yes - BE SURE you continue to use the pin! I had someone asking "who
lost the BLACK/BROWN pin one day. It was on my transmitter, but he assumed
that no one would be using it! I am just glad he asked!

2688. Irish longwave station on 254 kHz

Newsgroup: rec.ham-radio
Date: 1989-09-17 15:33:32 UTC
From: philiph@kean.mun.ca
Message-ID: <16777@kean.mun.ca>
Source record: 17067

A week or two (or four...) ago a number of poster in Eire made
mention of a newish longwave station on 245 kHz. They wondered if
anyone in North America was able to hear it. The hours of bc were
given as from 600 - 1800 UTC. No one has replied that I know of, and
since I may be the North American reader of this newsgroup closest to
the station, I thought I'd try.
The whole longwave band is generally pretty noisy and only rarely do
I hear anything on it which approaches intelligibility. There are a
lot of local and near-local beacons, of course, and I pick up a lot of
television set noise from my own house and neighbours. There is also
quite a bit of has and spurious signal from local mw transmitters.
But after dark I often hear North African and European broadcasters,
though almost never with enough signal to make clear identification.
So for a week or so I've been checking 254 for any sign of signal.
It gets dark here now just after 2100 UTC, so there's little chance of
hearing the Irish station late in the day: there is a fully daylit
path across the Atlantic when they shut down at 1800 UTC. By about an
hour or so after dark (about 2300 UTC or so) I have been hearing a
French language station on that frequency; I expect that it the
Algerian station listed in the WRTH (my most recent WRTH is last
year's).
So I set my Sony 2010 and my "voice-activated" recorder to come on at
0600 UTC. I assume that Dublin is just seeing the sunrise at 0600, so
there is a fairly complete dark path across the Atlantic then.
But no luck. I still haven't been able to hear the station. Mind
you, I am not using any kind of external antenna at all -- just the
ferrite bar in the 2010, though I do have that alligned for optimum
reception from the east.

I wonder if anyone else has tried to hear it?

Nakamichi makes an excellent wand-type head demagnetizer, but I've had
great results with the Radio Shack version; it's tip is lighted for
extra visibility, and it only cost ~$15. I've used this on my Nak for
a couple of years now, and I can't see spending more $ than this.

Most authorities recommend Isopropyl alcohol, at least 70% (available in
your local grocery store) but better is 90%, from your local drugstore.
The only this to watch for is whether or not the brand you buy leaves a
residue when dry; dab some on a piece of rubber and see. The stuff is
really cheap, and works well. If you want a commercial product, use
Discwasher fluid.

(...stuff on other thread deleted)
> I'm still not going to buy ham equipment from dealers that sell (illegal)
> CB linears.

Notice how hard it is to buy a linear that works on 10m??, the
outlaws had big guns, so they outlawed big guns....now only the
OUTLAWS have them and those of us with a license to run a Kw on
10m have to PROVE we are sane enough to buy one. Should I cross
post this to rec.guns???

As purveyors of self-policing, I too shall not want from dealers
in the un-ethical. Boycotting the bad is not only our responsibilty
but our most effective first step in turning things around.

Many thanks to those who have responded to my request for info
on "older rigs". I am fast gaining an education. Nothing beats
learning from those whom have tread this ground before. This net
group really can be useful.....

::::::::::::::::::::::::::::::::::
:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2060--Sept. 12, 1989 ::
::::::::::::::::::::::::::::::::::
```

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Bengt Dalhammar.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2060

CHINA--Radio Beijing can be heard in English with good strength at 14:00 hrs and at 15:00 hrs on 11795 kHz, which is a new frequency, and 15165 kHz. (P. Duryodhana, India)

CPBS-1 has been heard with fade in around 14:00 hrs on the unlisted frequency of 1368 kHz in parallel with 1359 kHz. The Voice of the Strait has also been noted fading in around 13:30 hrs, and then heard until 16:26 hrs, on 4900 kHz in parallel with 6000 kHz. (Valery Ostroverh, USSR)

COLOMBIA--Radio Sutatenza, which now belongs to the Caracol chain, can be heard regularly at 06:00 hrs on 810 kHz with local music and news. (Evangelista Gerardo, Argentina) Radio Sutatenza has also been noted in Spanish with fair to good strength at 04:00 hrs on 5075 kHz. (Gerd Wedemayer, West Germany)

Caracol Villavicencio has been observed with fair signals talking about Colombia at 0320 hours on 5955 kHz. (Dan Olsson, "ShortWave Bulletin", Sweden)

CUBA--Radio Habana Cuba can now be heard in Spanish to Europe from 18:00 hrs to 20:00 hrs on 15230, 15295 and 17710 kHz. (Eva Maria Solanes Morros, Spain)

Radio Habana Cuba has also been noted in Spanish from 18:00 hrs onwards on the new frequency of 21670 kHz. (Valery Ostroverh)

IRELAND--LMFM, located in the northeastern part of Eire came on the air Sunday Sept 3rd on 95.8 MHz. Century Radio came on the air Sept 4th only in

Dublin (103 MHz), Cork (98.8 MHz), and Limerick (98.4 MHz). Century Radio will within a few months be on 1143 kHz as well as on other FM frequencies. (Barry Hennessy, Ireland)

Updating SCDX-2057, Atlantic 252 began regular broadcasting on Sept lst at 07:00 hrs on 254 kHz and is now scheduled to operate from 05:00 hrs to 18:00 hrs. The address of the station is Atlantic 252, Box 252, London W1E 2RA, England. (Roy Patrick, Christopher Hancock, E. Janard, all England, and Volker Wachtendorf, West Germany.)

ITALY--Radio Benacus in Verona has now been reactivated and can be heard with German and Italian identifications around 03:30 hours on 1584 kHz where they operate with 5 kW. Radio San Luchino also operates on 1584 kHz. The address of this station is Via San Luca 35, 40135 Bologna, Italy. Radio Europe has been noted from 08:30 hours to 10:00 hrs on 7294 kHz. (Giuseppe Zella, Franco Magrone, and Dario Monferini, "Play-DX", Italy)

LEBANON--Sawt al Sha'ab (the Voice of the People) broadcasts in parallel on 936 and 1188 kHz. Programs in English can be heard from 11:00 hrs to 11:30 hrs. (Bo Goeran Karlsson, Sweden)

MAYOTTE--RFO Mayotte can often be heard after 17:30 hrs on 1458 kHz, when the Voice of the Maldives has signed off on the same frequency. RFO Mayotte is not featured in the WRTH l989, except in the frequency list. (Maarten van Delft, back from a vacation in the Maldives)

MEXICO--Radio Educacion in Mexico City was noted occasionally during the end of August with fair to good strength from 05:10 hrs onwards on 6185 kHz. This channel is also used by the Vatican Radio, which signs off after 06:10 and leaves the channel free. (F. Mendola, "Play-DX")

MONTSERRAT--The Deutsche Welle short wave relay station was closed at the end of June and the Deutsche Welle financial and technical support to Radio Antilles will end on December 31. This will make the future of the station uncertain and with that the relay facilities on MW and FM of the CBC, VOA and BBC. (Maarten van Delft, Netherlands)

NAMIBIA--The South West African Broadcasting Corporation at Windhoek has been heard in Afrikaans at 05:00 hrs on 3270 and 3290 kHz. (Evangelista Gerardo, Argentina) The SWABC has also been noted in English at 21:45 hours on 3270 kHz. (Gerd Wedemayer)

NEW ZEALAND--Radio New Zealand has for some time, been using 15485 kHz instead of 15150 l8:30-07:30 hrs. 11780 kHz is in parallel. Radio New Zealand is also on the air from 09:00 hrs to l2:05 hours on 9850 and ll780 kHz. Radio New Zealand can currently be heard in Europe from fade in around 05:30 hrs to sign off at 07:30 hrs on l5485 kHz. (Volker Wachtendorf)

PHILIPPINES--Radio Veritas Asia can now be heard in English to South Asia from 01:30 hrs to 02:00 hrs on 15220 and 15360 kHz and from 15:00 hrs to 15:30 hrs on 9525 and 15445 kHz. (Vasudev E. Parikh, India) There are also programs in Hindi from Radio Veritas Asia, which can be heard from 03:00 hrs to 03:25 hrs on 15360 and 17790 kHz and from 15:30 hrs to 15:55 hours on 9525

and 15445 kHz. (Manoj D. Bawda, India)

SRI LANKA--Due to the continuing diffcult situation in Sri Lanka the Deutsche Welle Trincomalee station is not yet fully operational. Only 2 of the 3 250 shortwave transmitters are on the air and the 600 kW MW transmitter is running at only 400 kW.

The station is on the air in German from 07:00 hrs to 10:00 hrs and from 10:00 hrs to 14:00 hrs, both on 21640 kHz and from 18:00 hrs to 19:55 hours on 21570 kHz. English can be heard from 02:00 hrs to 02:50 hours on 9615 and 11835 kHz, from 09:00 hrs to 09:50 hours on 17770 kHz, from 16:00 hrs to 16:50 hrs on 6170 and 7225 kHz, from 19:00 hrs to 19:50 hrs on 17810 kHz and finally from 21:00 hrs to 21:50 hrs on 9670 and 11785 kHz. (Maarten van Delft, who has spent a part of his holidays in Sri Lanka)

UNITED KINGDOM--The new independent station FOX FM is currently testing in the Oxford and Banbury area on 102.6 MHz. The official start of FOX FM is scheduled for September 15th. (Bradley Allen, England)

VATICAN CITY--There has been a slight change in the Scandinavian programs from Vatican Radio. Either Danish or Norwegian is broadcast on Mondays, Swedish on Tuesdays, Wednesdays, Thursdays and Saturdays and Finnish on Fridays and Saturdays. All programs are broadcast at 19:15 hours on 1611, 6185, 9755 and 11715 kHz. (Lars Rooth, Vatican Radio)

YEMEN ARAB REP--Radio Sanaa has been heard from 15:00 hrs onwards with good strength on 5950 kHz using the new 300 kW transmitter. The program consisted of news, a drama and finally a reading from the Koran. (T. Akabayashi, "SW DX Guide", Japan)

DX MEETING--A convention of shortwave listeners and DXers will be held near Auckland, New Zealand during the Easter Holiday Weekend April 13 to 16, l990. This convention will be hosted by the local branch group of the N.Z. Radio DX League at a beautiful coastal location 60 kilometers north of Auckland. 1990 is a special year for New Zealand, with celebrations including 200 years of European settlement and 150 years of nationhood. You can write to our contributor Douglas Doull, Box 3011, Auckland, New Zealand for further information.

PUBLICATIONS--On CompuServe a number of people have been wondering where the "International Listening Guide" has gone. Many people have not received an issue since the December, 1988 issue, which ran out in March this year. And Robin Viegas in India says "I ordered a one year subscription in March this year of the "International Listening Guide" but I have not heard anything since then.

Does anyone know what's happened to the ILG? It's been an excellent guide, and it would be a shame if it has suddenly vanished.

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features,

and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
03:00 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21675 kHz (East Africa)
17:00 hrs on 1179, 6065, and 9615 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

And to Asia and the Pacific:

12:30 hrs on 17705 and 21610 kHz
14:00 hrs on 17705 and 21610 kHz
01:00 hrs on 15390 and 17790 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 43 contributors this week Good Listening!

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Bengt Dalhammar.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2060

CHINA--Radio Beijing can be heard in English with good strength at 14:00 hrs and at 15:00 hrs on 11795 kHz, which is a new frequency, and 15165 kHz. (P. Duryodhana, India)

CPBS-1 has been heard with fade in around 14:00 hrs on the unlisted frequency of 1368 kHz in parallel with 1359 kHz. The Voice of the Strait has also been noted fading in around 13:30 hrs, and then heard until 16:26 hrs, on 4900 kHz in parallel with 6000 kHz. (Valery Ostroverh, USSR)

COLOMBIA--Radio Sutatenza, which now belongs to the Caracol chain, can be heard regularly at 06:00 hrs on 810 kHz with local music and news. (Evangelista Gerardo, Argentina) Radio Sutatenza has also been noted in Spanish with fair to good strength at 04:00 hrs on 5075 kHz. (Gerd Wedemayer, West Germany)

Caracol Villavicencio has been observed with fair signals talking about Colombia at 0320 hours on 5955 kHz. (Dan Olsson, "ShortWave Bulletin", Sweden)

CUBA--Radio Habana Cuba can now be heard in Spanish to Europe from 18:00 hrs to 20:00 hrs on 15230, 15295 and 17710 kHz. (Eva Maria Solanes Morros, Spain)

Radio Habana Cuba has also been noted in Spanish from 18:00 hrs onwards on the new frequency of 21670 kHz. (Valery Ostroverh)

IRELAND--LMFM, located in the northeastern part of Eire came on the air Sunday Sept 3rd on 95.8 MHz. Century Radio came on the air Sept 4th only in Dublin (103 MHz), Cork (98.8 MHz), and Limerick (98.4 MHz). Century Radio will within a few months be on 1143 kHz as well as on other FM frequencies. (Barry Hennessy, Ireland)

Updating SCDX-2057, Atlantic 252 began regular broadcasting on Sept lst at 07:00 hrs on 254 kHz and is now scheduled to operate from 05:00 hrs to 18:00 hrs. The address of the station is Atlantic 252, Box 252, London W1E 2RA, England. (Roy Patrick, Christopher Hancock, E. Janard, all England, and Volker Wachtendorf, West Germany.)

ITALY--Radio Benacus in Verona has now been reactivated and can be heard with German and Italian identifications around 03:30 hours on 1584 kHz where they operate with 5 kW. Radio San Luchino also operates on 1584 kHz. The address of this station is Via San Luca 35, 40135 Bologna, Italy. Radio Europe has been noted from 08:30 hours to 10:00 hrs on 7294 kHz. (Giuseppe Zella, Franco Magrone, and Dario Monferini, "Play-DX", Italy)

LEBANON--Sawt al Sha'ab (the Voice of the People) broadcasts in parallel on 936 and 1188 kHz. Programs in English can be heard from 11:00 hrs to 11:30 hrs. (Bo Goeran Karlsson, Sweden)

MAYOTTE--RFO Mayotte can often be heard after 17:30 hrs on 1458 kHz, when the Voice of the Maldives has signed off on the same frequency. RFO Mayotte is not featured in the WRTH l989, except in the frequency list. (Maarten van Delft, back from a vacation in the Maldives)

MEXICO--Radio Educacion in Mexico City was noted occasionally during the end of August with fair to good strength from 05:10 hrs onwards on 6185 kHz. This channel is also used by the Vatican Radio, which signs off after 06:10 and leaves the channel free. (F. Mendola, "Play-DX")

MONTSERRAT--The Deutsche Welle short wave relay station was closed at the end of June and the Deutsche Welle financial and technical support to Radio Antilles will end on December 31. This will make the future of the station uncertain and with that the relay facilities on MW and FM of the CBC, VOA and BBC. (Maarten van Delft, Netherlands)

NAMIBIA--The South West African Broadcasting Corporation at Windhoek has been heard in Afrikaans at 05:00 hrs on 3270 and 3290 kHz. (Evangelista Gerardo, Argentina) The SWABC has also been noted in English at 21:45 hours on 3270 kHz. (Gerd Wedemayer)

NEW ZEALAND--Radio New Zealand has for some time, been using 15485 kHz instead of 15150 l8:30-07:30 hrs. 11780 kHz is in parallel. Radio New Zealand is also on the air from 09:00 hrs to l2:05 hours on 9850 and ll780 kHz. Radio New Zealand can currently be heard in Europe from fade in around 05:30 hrs to sign off at 07:30 hrs on l5485 kHz. (Volker Wachtendorf)

PHILIPPINES--Radio Veritas Asia can now be heard in English to South Asia from 01:30 hrs to 02:00 hrs on 15220 and 15360 kHz and from 15:00 hrs to 15:30 hrs on 9525 and 15445 kHz. (Vasudev E. Parikh, India) There are also programs in Hindi from Radio Veritas Asia, which can be heard from 03:00 hrs to 03:25 hrs on 15360 and 17790 kHz and from 15:30 hrs to 15:55 hours on 9525 and 15445 kHz. (Manoj D. Bawda, India)

SRI LANKA--Due to the continuing diffcult situation in Sri Lanka the Deutsche Welle Trincomalee station is not yet fully operational. Only 2 of the 3 250 shortwave transmitters are on the air and the 600 kW MW transmitter is

running at only 400 kW.

The station is on the air in German from 07:00 hrs to 10:00 hrs and from 10:00 hrs to 14:00 hrs, both on 21640 kHz and from 18:00 hrs to 19:55 hours on 21570 kHz. English can be heard from 02:00 hrs to 02:50 hours on 9615 and 11835 kHz, from 09:00 hrs to 09:50 hours on 17770 kHz, from 16:00 hrs to 16:50 hrs on 6170 and 7225 kHz, from 19:00 hrs to 19:50 hrs on 17810 kHz and finally from 21:00 hrs to 21:50 hrs on 9670 and 11785 kHz. (Maarten van Delft, who has spent a part of his holidays in Sri Lanka)

UNITED KINGDOM--The new independent station FOX FM is currently testing in the Oxford and Banbury area on 102.6 MHz. The official start of FOX FM is scheduled for September 15th. (Bradley Allen, England)

VATICAN CITY--There has been a slight change in the Scandinavian programs from Vatican Radio. Either Danish or Norwegian is broadcast on Mondays, Swedish on Tuesdays, Wednesdays, Thursdays and Saturdays and Finnish on Fridays and Saturdays. All programs are broadcast at 19:15 hours on 1611, 6185, 9755 and 11715 kHz. (Lars Rooth, Vatican Radio)

YEMEN ARAB REP--Radio Sanaa has been heard from 15:00 hrs onwards with good strength on 5950 kHz using the new 300 kW transmitter. The program consisted of news, a drama and finally a reading from the Koran. (T. Akabayashi, "SW DX Guide", Japan)

DX MEETING--A convention of shortwave listeners and DXers will be held near Auckland, New Zealand during the Easter Holiday Weekend April 13 to 16, l990. This convention will be hosted by the local branch group of the N.Z. Radio DX League at a beautiful coastal location 60 kilometers north of Auckland. 1990 is a special year for New Zealand, with celebrations including 200 years of European settlement and 150 years of nationhood. You can write to our contributor Douglas Doull, Box 3011, Auckland, New Zealand for further information.

PUBLICATIONS--On CompuServe a number of people have been wondering where the "International Listening Guide" has gone. Many people have not received an issue since the December, 1988 issue, which ran out in March this year. And Robin Viegas in India says "I ordered a one year subscription in March this year of the "International Listening Guide" but I have not heard anything since then.

Does anyone know what's happened to the ILG? It's been an excellent guide, and it would be a shame if it has suddenly vanished.

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
03:00 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21675 kHz (East Africa)
17:00 hrs on 1179, 6065, and 9615 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

And to Asia and the Pacific:

12:30 hrs on 17705 and 21610 kHz
14:00 hrs on 17705 and 21610 kHz
01:00 hrs on 15390 and 17790 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 43 contributors this week Good Listening!

I've been receiving two local AM broadcast stations on my
Western Electric Model 600 telephone. I fixed the problem by
putting a 1000pF capacitor across two terminals within the phone
that seemed to work. (Putting it across the phone line didn't help,
in fact, a dead short across the phone line turned the phone into a
good radio!) This seems a hokey solution to the problem. Is there
a more respectable one?

At least a little of the BBC's income comes from over here - the local PBS FM station broadcasts what I presume is a live satellite feed of the BBC news every night.
It's interesting because it's exactly the same broadcast as on the shortwave, only a few tenths of a second later because of the bounce.

>your local grocery store) but better is 90%, from your local drugstore.

No! No! No! Whatever you do, never use less than 99%! Anything less
has significant water content to cause long-term oxidation of the metal
components in the mechanism (i.e. heads, capistan(s)) and thus wouldn't
be a terribly good idea. Anyway, every drug store has the stuff and at
just over $1 for 16 fl. oz., it really isn't out of the price range for
most audiophiles. I've heard of people using liquid freon, but can't
see any distinct advantages to this...

Yeah, we'd probably have ended up just like those other colonies, Canada and Australia, forever condemned to live under England's shadow and forced to put pictures of the Queen on all their currency just because the wimps opted for a relatively peaceful independence from Britain instead of fighting a bloody war -- the way Real Men do it. :-)

It is unwise to try to use "lessons of history" like this. For each example you point to where force succeeded, you can find others where prudence and cleverness were just as effective, and perhaps even more permanent.

Yes! I have also been monitoring this frequency, along with 7.060. Last night I listened as FM5EB on Martinique relayed real-time reports from another station on Guadaloupe as Hugo hit that island. It was interesting to see almost exactly the same reports appear on our AP newswire feed several hours later, though without any mention of amateur radio.

Regarding Commercial meteor Scatter [posting by Patty Winter, N6BIS]

Yes, indeed, there is a lot of commerical/military interest in
meteor scatter. After being eclipsed by satellites in the early
60's, meteor scatter is a hot topic again. SDI [Star Wars] has shown
that it's relatively easy to disable communications satellites.
Meteors, on the other hand, are always entering the Earth's atmosphere.
The F2 layers will likely have a lot of holes punched in it immediately
following Armageddon, but the more mobile E layer (where meteor scatter
ionoization takes place) will regain its integrity very quickly.
So, although data throughput rates are terribly low, reliability is
exceedingly high. The same applies to polar paths easily upset by aurora.
Several companies are doing contract research for the Air Force or other
aerospace companies, resurrecting the excellent studies done in the 50's
and 60's. The Soviets never really stopped studying meteor scatter,
so they're way ahead of us.
The major unanswered questions relate to the size and space distribution
of the so-called "sporadic" meteors; shower meteors are somewhat better
understood and much more predictable.

2699. Squint angle? and AO-13 performance

Newsgroup: rec.ham-radio
Date: 1989-09-18 12:43:14 UTC
From: gopstein@soleil.UUCP
Message-ID: <793@soleil.UUCP>
Source record: 17074

I have noticed that the downlink signal from AO-13 varies greatly during a single orbit. The signal strength seems to be related to more than just the distance to the satellite. I've heard people mentioning "squint angle", but I'm not sure exactly how to figure out what a good squint angle is. I assume it's when the antennas are pointed at you.

The question is:

In an elliptical orbit, what is the orientation of the satellite as it moves through a single orbit. Is the axis of the satellite always perpendicular to the orbit, or is the axis always pointing through the center of the earth? Or is it something totally different?

Thanks.

Rich, KD2CQ

To: all\@allbbs $1609_N2DSY
Fr: J. Gordon Beattie, Jr. N2DSY
Sb: Distribution + Hierarchical Routing Names

I am collecting information for a Amateur Radio directory service. The items I am looking for are outlined below, but in short, please send me the distribution group names and the hierarchical routing names used in your area.

The results will be posted in all the usual places with the intention that it will reduce conflicts and help the packet community evaluate what enhancements are needed to handle future growth. It will also provide a few references for folks wishing to add new names to the list.

I. DISTRIBUTION GROUP NAMES
Please send in the distribution list names used in your area to distribute bulletins, group messages etc.

Examples of these include:

"all\@allbbs", "rats", "all\@nynet", etc.

This includes private lists such as "ratsmbr" (rats members). In the case of distribution group names please include the current distribution and if there are limitations on who may use this list when addressing a message.

II. HIERARCHICAL ROUTING
Please send in the hierarchical routing entries used in rfc822-like domain strings found in messages. These usually include a "#" at some point in the string.

III. WHAT TO SEND IN?

Please send the following information with the entry:

1. Entry

2. Region or group using the entry

3. Responsible individual/club/net
(include contact information, if known)

3. Systems supporting it
(if known)

4. An example of how this is used
(Command lines, sample messages into and out of the
system performing distribution would be helpful.)

5. The format of the BID associated with the distribution name.
(e.g. is there a special character sequence used with the
messages, or is the numeric sequential or a date, etc.)

6. Message type(s) used in conjunction with the group name,
hierarchical routing designator, etc.
(e.g. "traffic", "bulletin" "private", etc.)

7. Any notes which would improve understanding.

IV. WHERE TO SEND THE INFORMATION

Send your replies to any of the following:

n2dsy\@kd6th(packet)
n2dsy\@kd6th.nj.usa.hamradio.org.iso (iso/packet)
n2dsy\@hou2d!att.com (internet)
72417,652 (compuserve - use easylink)

If you have any questions or comments send them to me via any of
the email addresses listed above, or call me on the telephone.

Thanks + 73,

J. Gordon Beattie, Jr., N2DSY

Message-ID: <8909190708.AA28126@ucbvax.Berkeley.EDU>
Source record: 17076

Here's some interesting info that showed up on the "Aviation" list. For those interested in aviation-radio monitoring, this may mean a chance to acquire some relatively fancy and otherwise-expensive radios for cheap, or even free. If the radio becomes illegal to use in an aircraft, and the possible exceptions mentioned in the second message don't get approved or are not applied, the radios will become essentially worthless.

Then a monitor could get one and rig up an appropriate power supply and housing, getting a aircraft-band monitoring radio for a minimal investment. The transmitter portion could be deactivated or not, as deemed appropriate. I think all of these have digital readouts (probably mechanical as opposed to electronic).

Regards, Will

----- Forwarded message # 1:

Date: 13 Sep 89 15:40:36 GMT
Subject: Illegal Radios on Jan 1,1990
From: Mike King <king@hpfcdj.hp.com>

(The following information taken from the Sept 89 issue of
the American Bonanza Society newsletter)

On Jan 1,1990 your aircraft must be in compliance with a new rule that will make many of the current radios in use illegal.

The Federal Register, Volume 53, Page 147 contains a new rule issued by the FCC (not FAA) called "Paragraph 87.133, Frequency Stability."

This rule, proposed by the FCC way back in 1985, apparently will tighten the frequency tolerance of airborne radios.

The current list (of soon to be illegal radios) is as follows:

King KX-100
King KX-150
King KX-160
King KX-170
Narco Mark-12
Narco Mark-12A
Genave 100
Genave 200
Genave 200A

In general if you have a 90 or 360 channel radio made before Jan 1,1974 it will probably be illegal.

GAMA and AOPA are circulating a proposed petition to the FAA and FCC
for relief from this rule, but don't expect anything since this
rule was proposed in 1985.

As soon as I have further information I will post it.

----- Forwarded message # 2:

Date: 15 Sep 89 16:06:24 GMT
Subject: Illegal Radios on Jan 1,1990
From: Bob Toxen <bob@cloud9.stratus.com>

According to a local radio shop most 720 channel radios can be made legal
by tuning them and/or minor modification. These include the King 170B,
my old Edo-Aire, and many others.

AOPA has a reasonable chance of getting the right for people to get exemptions
from the requirements. These exemptions will not be good in other countries
such as Canada. For VFR to these one could go No Radio.

Picked up a copy of Antique Electronic Supply's catalog. They have
mounted galena crystals at $2.00 (#G-111), Cat's whisker's at 3/$1.00
(#P-415) and a reproduction of a Wm. B. Duck Co 1921 "Junior Detector
Stand", with brass and mahogany fittings for $24.95. (#G-158) as well
as dozens of other neat antique accessories, parts, books and tubes.
Also a good source of parts useful for hams- solid state vibrator
replacements at $14.50-18.50, coil forms, and a variety of tubes:
807s for $7.00, Chinese-made 811s for $14.50, etc. The catalog is $2.00.
They're at 602-894-9503, or write 'em at 688 W. First Street, Tempe, AZ
85281. Minimum order is $10.00, and while I've never dealt with them
I've heard good things. I'm ordering a can of brown wrinkle finish paint
and some beryllium-copper belt material for my Atwater-Kent 32.

From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <166557@Wayne-MTS>
Source record: 16829

Picked up a Boonton (model 101?) UHF grid dip meter this weekend at, of all places, an antique radio swap. Go figure. It's a nice machine, ex-NASA, and covers 300MHz to 1GHz with three coils. It uses a remote head, a la Measurements grid dip meter. Seems to work, and for $15...!

To the point: I'd like a schematic, if anyone has one (though it's not strictly necessary for anything this simple...) and more importantly, I'd like to know what other heads were available for it. If I could find an HF head I could donate my old Eico to some deserving Novice.

Also found a pair of Fairchild digital multimeters (nixie type, also ex-NASA) in a rackmount, working, for $8! There's a moral in here somewhere about looking for things in the wrong places, but I can't quite figure out what it is...

Considering that the problem comes from audio level setting diodes within the telephone set itself I would hardly call your solution "hokey". The only "hokey" thing about it is a manufacturer who blithely assumes that RFI is rare just because it was 50 years ago!

So long as the fix and the phone work I would just go on using it! You might try ferrite beads on the wires to the phone as well if the capacitor isn't enough too.

> The article indicates the preamp operates at 10.12 GHz. Is this fixed?
> how would it perform at 10.368? Any suggestions on trimming the stripline
> components to this more optimum frequency?

I have not seen this preamp design, but would expect any stripline layout
to have enough bandwidth to easily cover 10.12 to 10.368. The only
type of design that wouldn't would have a filter on the input and that would
destroy the preamp noise figure (if done in stripline). Almost any stripline
design can be tweaked a little bit for improved performance simply because of
etching and layout errors on stripline width etc. It's usually done by moving
around small copper tabs on the stripline. When performance peaks, solder the
tabs in place.
If you havn't seen QST recently you should
check out an article printed this spring by Al Ward, WB5LUA, who gives
microwave preamp designs for 1.3 to 10.368 GHz using Avantek devices. There
are two 10 GHz preamps, a one stage and a two stage. I built the one stage.
It works. (These designs are also published in a conference proceedings,
either Microwave Update or CSVHF I'm not sure which).

Is it possible to modify this radio for extended receive. I would like to hear from anyone who has done it, seen it done, or knows it to be impossible (easily). Thanks.

In article <13681@well.UUCP> John Nagle asks:

I've been receiving two local AM broadcast stations on my
Western Electric Model 600 telephone. I fixed the problem by
putting a 1000pF capacitor across two terminals within the phone
that seemed to work. (Putting it across the phone line didn't help,
in fact, a dead short across the phone line turned the phone into a
good radio!) This seems a hokey solution to the problem. Is there
a more respectable one?

Hmmm, a fifty-cent solution that works -- what's so unrespectable about that?

Both CNN and WXYZ (Channel 7 in Detroit) have been giving good press to the amateur radio operators during their coverage of Hurricane (Himmicane?) Hugo. We need more of this kind of press. Perhaps when field day rolls around next year, we can remind the media of our service during this disaster, and provide them with a good videotape copy of some of their coverage in case they haven't saved it.

Maybe if the ARRL had their act together, and let us know about this national Amateur Radio day early enough (if there was coverage, it wasn't enough because most of us didn't know about it), we could have somehow tied these events together. (We did know the hurricane [himmicane?] was comming).

Unfortunately, the ARRL has been trying their best to destroy amateur radio by: (1) removing technical columns from QST, (2) promoting novice enhancement (that DID NOT bring significantly more new operators in, and is bad in that it removes incentives for upgrading), and (3) promoting a code-free VHF license (which I predict also WILL NOT bring in a significant amount of new operators: 5 wpm cw is just not a barrier for anybody SERIOUSLY interested in becoming an amateur). I don't want to turn this into another cw/no-cw debate; I just want to express my concern that the ARRL is not operating in the best interests of amateurs now, nor have they been for a couple of years. Removing the small microwave columns from QST was the straw that broke the camels back, and has prompted me to not renew my membership when it comes up again.

Imagine Oscar-13 as a spinning top. It points at the same direction in inertial space until it is told to change by a ground station. As the satellite moves around the earth, however, the antenna direction appears to change.

Normally, Oscar-13's antenna is pointed directly at earth at apogee. During certain seasons of the year, however, it is necessary to "off point" the antennas in order to maintain acceptable sun angles on the solar arrays. This is usually done by moving the spin axis within the plane of the orbit; that means the antennas will still be pointed directly at earth at some point in the orbit, but that point will no longer occur at apogee. This results in the best communications occurring either before or after apogee.

Alcohol is okay for the heads, but KEEP IT OFF THE RUBBER. The alcohol will
make the rubber old before it's time, drying it, and causing it to harden and
loose traction.

As recommended don't use the 70% alcohol. Get the "pure stuff" at your
drugstore - typically used for cleaning syringes, etc.

And if you want commercial stuff - don't go with the Discwasher fluid. Get
some professional cleaners - I have had excellent results with the chemicals
from Miller-Stephenson. They even make a head cleaner for pro-video recorders
that can be sprayed on while the unit is playing/recording. Good stuff!

Two general areas to check out--

Corroded, loose, or missing ground connection

Corroded, or loose other connections.

(That makes up one area)

Noisy carbons. (Find the protector--where the teloc wires transition to the house wire. Unless theprotector is very old, it will have what appear to be two large brass screws. You will discover that you can remove them without changing any thing. If you remove them and the radio goes away--the carbons you now have in your hand nead to be replaced. Put them back and complain to the telco.

I would have to say that your comments on Novice Enhancement are pure
rubbish. It is what made me serious about getting my license; I had toyed
with the idea since I was 12 years old, but after NE I actually did it,
and I have upgraded to Tech and now General. Anyway, I don't see why
someone should be pushed into upgrading if they don't want to. There
is probably a large number of people who would be interested in
VHF/UHF/Microwave/Repeaters who wouldn't give a crap about 20M DX pileups.

One thing about the ARRL's "Communicator" proposal: I'm trying to figure
out why they put the thing in it that says that a "Communicator" should
not be allowed to be the control operator of a repeater, when a Technician
can. Is passing a 5WPM code test going to make someone a better repeater
owner/operator?

If this is correct (and I assume it is...) then at perigee any antennas
mounted "underneath" the satellite will be pointing away from the earth...
Either the antennas aren't mounted "underneath" the satellite, or you
really can't communicate with the satellite at perigee...

How about geostationary satellites??? Are they constantly (actively)
re-orienting themselves to point to earth?

The Central Connecticut Hams will be operating a Special Event
Amateur Radio station, W1GB, at The Durham Fair, Durham, Connecticut,
September 22-24. There will be live, continuous Amateur Radio activity,
including exciting demonstrations of various modes of Amateur Radio
communication, and attempts to contact other Amateur Radio stations
in every State and many countries around the globe. Visitors to the
station are invited to send FREE RADIOGRAMS to friends and relatives
all over the US, Canada, and several foreign countries.
The public is enthusiastically invited to attend, & licensed
Amateur Radio operators are encouraged to drop by to join the fun and
spend some time operating the station!! Licensed Amateurs are also
welcome to volunteer to help handle message traffic and conduct radio
contacts.
There will also be free pamphlets, brochures, & video
presentations describing the world of Amateur Radio, and plenty of
information and assistance available to people interested in becoming
licensed participants in this fascinating Public Service hobby!

For more information, please call
Bob Schulte, KA1RDX at (203) 349-1373

After as many years as these puppies have sat in aircraft, been bashed about, and obsoleted themselves, it's hardly worth the bother. A basic, simple, synthesized scanner gets all 720 channels (not just 90 or 360 as these old things do), has its own power supply, and comes with a real case. They aren't that fancy inside. Fairly durable, yes, but ten or more years of being subjected to aircraft use is probably testing the limits of that.

What makes them expensive is the bureaucracy of obtaining FCC and FAA certification, and the controlled market, not their quality or technology.

About the only thing which these radios offer is the ability to work with VOR indicator heads. Which is not much use on the ground.

I have an old Bearcat 210, which I use constantly here for monitoring the old 152 mhz telephone band. The old 210 (NOT 210xl or other variation, but the original 210) has TONE SQUELCH, and thus is a godsend for those who monitor mobilphones.

Well about 2 years ago the scanner started to lose its memory when the power was turned off. It might have been that way a long time, but I noticed it when my girlfriend turned it off because it was noisy. Generally all my scanners run 24 hours a day.

I figured it was no big deal if the scanner lost its memory that way, as my old BC-100 is like that by design.

But now the following symptoms occur.

The scanner will begin to display very odd frequencies like 13.705 or 21.400 even 9.540 which are completely out of range. BUT it continues to receive on the proper frequency.

BUT sooner or later all channels become 512.000 and it no longer receives.

I am thinking that the later problem could occur from a micro power outage.

Does anyone know what the BC-210 uses to back up memory. I doubt that there were lithium batteries in the stone age, and I assume a capacitor memory of some sort.

Since there were very few scanners made with tone squelch, I really want to keep this old hog, and would like it even better if it worked. After a few hours of silence I know it needs to be reprogrammed, and last night I had a dickens of a time getting it to enter the right frequencies.

I know that parts are not available from Electra any more, but saw an add somewhere from someone who bought the parts out.

Any help would be appreciated.

Cross-posted to: rec.ham-radio,sci.electronics

The current Electronic Design (9/14/89) has a piece on the new Burr-Brown PCM1705P, a monolithic dual analog-to-digital converter. It runs at 200 kHz, gives 14-bit accuracy and 18-bit resolution, and costs $27 in 1K quantity (I'd guess <$50 in onesies). It's designed for high-end home audio, DAT and effects and such, but the article is mostly about how you can hook it to a DSP & use it for medical, telecommunications, spectrum analysis, imaging, etc.

I wonder if any DSP radio experts out there can comment on whether this chip, with an 80 kHz or so IF front end on the input and a DSP on the output might make a practical HF receiver, using the DSP for most of the selectivity, gain control, and demodulation? Is it reasonable to use that low an IF? Could you use both ADCs on the chip to alternatively sample a higher IF, like 160 kHz?

Imagine how fast, cheap ADCs and DSPs could cause a revolution in receiver design (especially when we get cheap ADCs and DSPs that can handle several MHz IFs, and direct digital synth chips to match):

```
Antenna ---> Mixer ---> LPF/gain --> ADC -----> DSP -----> DAC -----> audio
^ |
| |
DDSynth \------> data
```

A few real RF stages + cheap digital VLSI = high-performance receiver?

If one takes this one step further, to a time of 80 MHz wide dynamic range ADC
chips (2000? 2010?):

Antenna ---> LPF/gain --> ADC -----> DSP -----> DAC -----> audio
|
|
\------> data

To heck with superhet, just digitize the HF band and process from there!

>Either the antennas aren't mounted "underneath" the satellite, or you
>really can't communicate with the satellite at perigee...

Yes, you're right -- at perigee, the high-gain antennas point away from the earth. That's why the satellite generally has two antennas for each band; it can switch to the low-gain antenna around perigee. In actual operation, though, the transponder is often shut down around perigee because that's where eclipses occur. Even when an eclipse doesn't occur, the battery often needs a rest.

>How about geostationary satellites??? Are they constantly (actively)
>re-orienting themselves to point to earth?

Yes. There are two general classes of geostationary satellites: 'despun' and '3-axis stabilized'. The first type spins around an axis parallel to the earth's rotational axis, but mounted inside the spacecraft along this axis is a "despun platform" on which is mounted the antenna. This platform is driven by a servo motor that keeps the antennas continuously pointed at earth. These satellites are cylindrical in shape and covered with solar cells so that power is continuously generated as the satellite spins.

The 3-axis stabilized type does not spin, but its body rotates about a north/south axis once per day in order to keep antennas pointed at earth. These satellites usually have solar panels mounted on north-south shafts that rotate in order to keep the panels perpendicular to the sun as the spacecraft body tracks the earth.

Neither type of spacecraft is always superior. Spinners tend to be easier to design thermally, but they require despun bearings (expensive) and their solar arrays aren't fully utilized; for a given total array area you only get 1/pi of the output you could get if the entire array faced the sun continuously. 3-axis types use their solar arrays more efficiently, but they need a sun tracking mechansim. Also, the sun only appears to circle the body of the spacecraft once per day, so thermal design is much more difficult. Heat pipes are often used to conduct heat from the sunlit side to the shadowed side.

AMSAT Phase IV is a hybrid of these two techniques. It looks like a spinner, but it's actually 3-axis stabilized. This avoids expensive moving parts on the spacecraft, such as the despun bearing and solar panel drive mechanism.

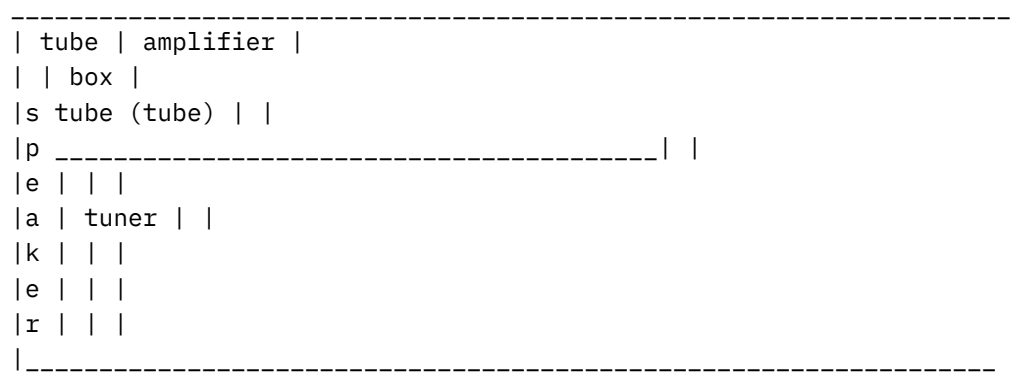
Hi,
it's me again.
Last semester I asked for information on the Siltronix 1011D Commanche
10 and 11 meter rig. Some unnamed benefactor in Alaska at LKI Communications
(I hope I got the name right) sent me a photocopy of the tube layout from a
manual for the 1011C. This turned out to exactly match my rig, which I guess
is a 1011C with 1011D labels. Well, at any rate, I lost the photocopy.
I want to thank the person who sent me the paper. All I need is an E-mail
listing of the tubes, or really the tubes in the middle.
Here's a map. The only real problem is the tube in parentheses.
If someone can tell me it's name, that should cover the whole problem.
If someone would send me a photocopy of the tube map from a Siltronix 1011C,
tell me by E-mail at CONWAYT@WABASH and I'll send you a SASE and a greenstamp
to cover copying and inconvenience.



I think it is a 12ba6 or something similar.

2733. Cross Band Repeaters & National FM Simplex Calling Frequency

Newsgroup: rec.ham-radio
Date: 1989-09-19 19:54:00 UTC
From: hicks@CONSRT.ROK.COM
Message-ID: <8909200728.AA17005@ucbvax.Berkeley.EDU>
Source record: 16870

Please....Please....PLEASE:

DO NOT CROSS-BAND REPEAT YOUR RIG USING ANY NATIONAL CALLING FREQUENCY!!!

It is understandable that people extend effective range, use other bands, etc. with the cross-band radios, but please respect a time honored tradition of using NATIONAL CALLING FREQUENCIES for their intended purpose only. Put yourself in the shoes of an air-mobile station: a repeater on every frequency makes communications equipment useless. I'm not going to beat this issue into the ground: either you understand the implications and will help other hams to coexist in the band with you or you won't.

2734. What's your favorite 6m rig?

Newsgroup: rec.ham-radio
Date: 1989-09-19 20:17:38 UTC
From: lyndon@cs.AthabascaU.CA
Message-ID: <1110@aurora.AthabascaU.CA>
Source record: 16860

Between the recent solar activity and my lack of space for an antenna I've decided it's time to get serious about 6 metres. Therefore, I'm looking for recommendations for a 6m all-mode rig. The primary requirement is for GOOD receive specs - bells & whistles don't pull in DX. Not having a lot of bucks to put into this I will more than likely be restricted to a single band rig, although I do recall reading about a 6/10m rig that might do the job.

Send email -- I'll summarize.

Thanks, Phil. Does this mean that those of us with tracking programs that
don't figure squint angle (like MacTrak) can use a simple table relating MA to
squint angle, at least when the antenna is not off-pointed?

2736. Comments about the Yaesu FT-726R rig

Newsgroup: rec.ham-radio
Date: 1989-09-19 20:31:00 UTC
From: STELLABO@CSHLAB.BITNET
Message-ID: <8909200728.AA16995@ucbvax.Berkeley.EDU>
Source record: 16869

Can anyone offer any comments about the Yaesu FT-726R rig. I would like to use this rig for satellite communications, 440 packet, and just some rag chewing on six meters.

I know the rig is out of production so can anyone give me an idea of what a good used price is ??

Is it compatable with all of the modes that I want to use it for ???

Are there any major GOTCHAAs .. ???

Thanks in advance ....

Fred Stellabotte - N2JCD

2737. Re: Meteor Scatter

Newsgroup: rec.ham-radio

From: tenney@c3.PLA.CA.US
Message-ID: <197@c3.PLA.CA.US>
Source record: 16856

A friend was telling me of some seismic sensors that use scatter.
He was saying that the sensors gather data waiting to hear something
on a certain freq (I don't recall if he said it was noise caused
by the scatter or if they used the scatter) and then sent the
data in a burst using the scatter (since it was there 'cause they
received via scatter). Sounded legit to me. Does anyone know more
info? If this is for real, then it is already commercial.

>radio every week??? How often do you buy a new radio?? The only way to
>get volume sales is if the number of hams starts rising. Lets hope this
>happens so more people will carry ham gear.

I'll throw out one other reason that ham gear (and, for that matter, shortwave receivers) is not being sold by general merchandise outlets like those mentioned above -- it's because there is no one pushing it to the buyers for and managers of these retail stores and chains! There seems to be absolutely NO trade press for ham radio, for example, while there are several different periodicals for dealers in audio, video, and other consumer electronics, and the giant Consumer Electronics Show twice a year where manufacturers push their wares to the dealers. But *nothing* like that, even in a small way, for the ham-radio and SWL marketplace!

There is a synergistic effect at work here -- if the only place this equipment is sold is at speciality shops, hard to locate and off the beaten path, only people already motivated to seek them out will ever enter those shops and be potential customers. But if there was a ham-radio dealership or even just a subsection of a department or other large store in every other shopping mall, the hobby would be exposed to a wide cross-section of the populace, and therefore more people would end up becoming interested in it, and would be motivated to get licenses and become hams. Then, the people on this list would be complaining about how there were too many new hams, not about how few there were! :-)

I think it is a classic chicken-and-egg situation. Few hams mean few stores and little commercial interest in the market, which reduces the attraction of new people which means fewer hams... a downward spiral.

Regards, Will

It might be the case that the majority of this activity is from Technicians
who have been active all along above 50 Mhz and are taking advantage of the
new SSB privileges (they forgot the code remember) to try out 10 meters during
the sunspot cycle.

Maybe if they get hooked, they will upgrade to General, Advanced, or Extra
for the downside.

From: kenny@m.cs.uiuc.edu
Message-ID: <13900010@m.cs.uiuc.edu>
Source record: 16859

Thanks, Phil, for the description of spin angle and how it is chosen. It seems as if the original poster needs some more information, though.

The antenna pointing information is given in the AO-13 schedule with the BLAT and BLON parameters (Can someone give me an idea how to interpret these? Is longitude relative to the ascending node, and latitude relative to the orbital plane? I speculate this because BLAT is nearly always zero and BLON is close to the argument of periapsis.)

These two angles define a vector describing the spacecraft's spin axis. The `squint angle' is the angle between this vector and the range vector (the vector joining the station's position with the spacecraft's position). Given the directionality of the antenna, one generally wants the squint angle to be as near zero as possible.

If the squint angle is greater than 90 degrees, then the station is looking into the back of the spacecraft's antenna. As this situation most often happens near perigee, it is sometimes possible to work the spacecraft well during those times. One must be aware, though, that the polarization of the signal will be reversed; this is the reason that it is wise to use an antenna which can be set to operate with signals of either helicity.

The antenna design aboard AO-13 has a significant sidelobe at one particular range of obtuse squint angles; it escapes me at the moment what angles these are. Phil, can you get this information?

Kevin

From: GB7HQQ@GB7HQQ

The Harlow Rally takes place next Sunday, the 24th, at the Harlow Sports Centre. This year the doors open at 10.30am - not 10am, as in previous years - and the event ends at 5pm. There is ample free parking, and talk-in will be available on S22 via G6UT. As well as the usual rally attractions, there will be a very large bring-and-buy section. More information is available from G4MIS on 0279 722622.

It's been announced that His Majesty the King of Thailand has taken the amateur radio callsign HS1A. We expect to have some more information in the next edition of Radio Communication.

It's understood that ZC4 stations are now allowed access to the 50MHz band, although no information on licensing conditions is available yet. ZC4MK has already been active from the Episkopi club station and monitors 28.885MHz whenever possible. Issue of 50MHz permits in Luxembourg is also thought to be imminent.

Next, the results of the Raynet Zone 2 election. Mr W F Marshall, G4IOD, received 9 votes. Mrs P M Smith, G4ZWQ, received 30 votes. There were 7 spoiled votes. Mrs P M Smith has therefore been elected as representative for Raynet Zone 2.

Observers of the GB3SUT beacon on 432.890MHz may be surprised to hear periods of extreme signal strength, coupled with rapid drifting to a lower frequency. It's understood that this is not the beacon but a satellite, of which the origin is currently unknown. The spacecraft is transmitting on 432.88MHz with what appears to be a plain carrier and signals are very strong at times. Passes for the UK for today are at 1430 to 1439, 1620 to 1639, 1811 to 1832, 2002 to 2021, 2153 to 2206 and 2342 to 2351. The Society would be grateful for any further information.

The Chiltern DX Club is pleased to announce that it will be sponsoring trophies for both the CQWW SB and CW contests, starting with this year's events. A trophy will be awarded for the top-scoring multi-band single-operator entry from the UK, and it is hoped that these trophies will encourage more UK stations to take part. The Chiltern DX Club

will have a stand at the forthcoming HF Convention and will be pleased to meet potential new members. More information is available from G3XTT via GB7WOK.

Chichester & District Amateur Radio Club will be operating GB2NM from the Chalk Pits Museum at Amberley on the 23rd and 24th of September.

DANPAC, the Derbyshire & Nottinghamshire packet support group, will be holding a meeting next Sunday, the 24th of September, at the Boat Club in Long Eaton. The meeting will begin at 3pm and the doors open at 2.30pm. Details and directions are available from G4XMH on 0602 736441 or via GB7LED; visitors will be very welcome.

A new QSL bureau sub-manager for the G4AAA to G4HZZ series has been appointed. He is Mr R Morshead, G0AEQ; his address is 4 Osmans Close, Bracknell, Berkshire RG12 6PX.

The Post Office has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0MH and G7FS series.

To: NEWS@GBR
Subject: GB2RS 17 Sep (2/10): SOLAR NEWS
Path: GB7NWP.GB7CDM.GB7DQW.GB7SUT.GB7LRG.GB7SPV

From: GB7HQQ@GB7HQQ

There was a major increase in solar activity during the period between the 4th and the 10th of September. There were X flares up to 1.4 stroke 2B on the 9th and ten flares up to 1,400 flux units, with a number of ionospheric disturbances. Flare alerts were in force for most of the period. Spot counts increased every day and reached 395 on the 10th - the second highest figure so far for this cycle. Solar flux levels also increased from 261 units on the 5th to 305 on the 9th, giving an average of 286 units for the period.

The geomagnetic A index was unsettled until the 8th, after which it became quiet; the average for the period was 13 units. The radio quality indices have been well above normal, and they were very high on the 6th and 8th. The Inda index for the period between the 21st and 27th of August was up to storm levels and reached 47 units on the 23rd. During the period between the 28th of August and the 3rd of September the index was at quiet levels, although it reached a storm level of 66 units on the 29th.

And now the ionospheric data for England and Wales. Daytime F2 critical frequencies at Slough as reported by Appleton increased to the highest levels since last May - they reached 10.5MHz on the 10th, and the average for the period was 9.7MHz. The darkness hour lows also rose slightly and averaged 4.8MHz. There was no spread F, and there were only a few periods of other phenomena. The lows occurred very

consistently at around 04 hours, although the daily highs took place anywhere between 11 and 19 hours from day to day.

And now the ionospheric data for Scotland and Northern Ireland. The daytime F2 critical frequencies at South Uist averaged 8.5MHz, which was the best level since last May. The 6th and 9th saw levels of 9.1MHz. The darkness hour lows averaged 4.6 MHz but there was still a great deal of spread F, which lasted up to 9 hours on some days. Other phenomena was also present during most afternoons and lasted up to 6 hours. However, the general trend is for the northern ionosphere to become more stable.

And finally the solar forecast. The quieter side of the sun will be facing Earth this week and flux levels may fall to just below 200. Geomagnetic levels will probably be quiet. Ionospheric M.U.F.'s at equal latitudes are expected to reach 30MHz in the south and 26MHz in the north. Darkness hour levels are not expected to change much, and 14MHz should be possible.

Meeting on Monday the 18th

Stourbridge & District Amateur Radio Society meets at 7.45pm in the Robin Woods Centre, Stourbridge for a talk on the Royal National Lifeboat Institution by Mr S Hodgson. More information is available from G4IEB on Stourbridge 392006.

Meetings on Tuesday the 19th

Stafford & District Amateur Radio Society meets at 8pm at the Universal Sports Club, Doxey Road, Stafford for a talk on QSLing and awards by G4OUT. More information is available from G3ESW on 0785 662350.

Midland Amateur Radio Society meets at 7.30pm at Unit 16, 60 Regent Place, Hockley for a junk sale. More information is available from G1ZCY on 021-443 5157.

Meeting on Wednesday the 20th

Telford & District Amateur Radio Society meets at 8pm in Dawley Bank Community Centre, Telford to discuss proposals for 430 and 1296MHz FM and TV repeaters for the area. More information is available from G7BWQ on Telford 770922.

Meetings on Thursday the 21st

The Amateur Radio Club of Nottingham meets at 7.30pm in the Sherwood Community Centre, Woodthorpe House, Mansfield Road for a DF foxhunt. More information is available from G1WBZ on 0602 733740.

Solihull Amateur Radio Society meets at 7.30pm in the Shirley Centre, Stratford Road, Shirley for a talk on power supplies by G3NXC. More information is available from G8AYY on 021-783 2996.

Meetings on Friday the 22nd

Coventry Amateur Radio Society meets at 8pm at Baden Powell House, 121 St Nicholas Street, Radford for an indoor DF contest. More information is available from G4HHT on 0203 610408.

Mansfield Amateur Radio Society meets at 7.30pm in Westfield Folk House for a talk on Worked All Britain. More information is available

from G4GYU on Mansfield 27257.

Meetings on Monday the 18th

The UK FM Group has its annual general meeting at 8pm in the Grappenhall Community Centre, Bellhouse Lane, Grappenhall, Warrington. More information is available from G3LEQ on 0565 4040.

Todmorden & District Amateur Radio Society meets at 8pm in the Queens Hotel, Todmorden for a talk on observing sporadic E G3OTE. More information is available from G0AEL on Halifax 882038.

Meetings on Tuesday the 19th

Wakefield & District Amateur Radio Society meets at 8pm in the Community Centre, Prospect Road, Ossett for a quiz night. More information is available from G1XYT on Leeds 872059

Halifax & District Amateur Radio Society meets at 7.30pm in the Running Man public house, Pellon Lane, Halifax for its annual general meeting. More information is available from G0DLM on 0422 202306.

Liverpool & District Amateur Radio Society meets at 7.30pm in the Churchill Rooms of the Conservative Club, Church Road, Wavertree, Liverpool 15 for a surplus equipment sale. More information is available from G6VS on 051-733 6415.

Meeting on Wednesday the 20th

Wirral Amateur Radio Society meets at an unspecified time and venue for a talk on simple receiver construction by G3RJV. More information is available from G3FOO on 051-644 6094.

Meeting on Thursday the 21st

Spen Valley Amateur Radio Society meets at 8pm in the Old Bank Working Men's Club, Mirfield for a talk on the White Rose receiver project by G3TDZ. More information is available from G0FOI on 0274 875038.

Meetings on Friday the 22nd

South Manchester Radio Club meets at 8pm in the Sale Moor Community Centre, Norris Road for a surplus equipment sale. More information is available from G4BZO on 061-231 5870.

Maltby Amateur Radio Society meets at 7.30pm in the Parish Hall, Clifford Road, Hellaby, near Rotherham for a book and magazine night. The Maltby club is also holding an open day in Maltby Comprehensive School, Braithwell Road on Saturday the 30th of September between 2pm and 5pm. There will be demonstrations of various aspects of amateur radio, and all are welcome to attend. More information is available from G1PQW on Rotherham 814135.

>Subject: How does a picture tube rejuvinator work???

>The B&W portable TV I use for a computer monitor has a weak picture
>tube. I need help rejuvinating it.
>
>?As I remember, you overvoltage the filament to make it really hot.
>Then you pulse high voltage for a few seconds from the cathode
>to some other element to blast off the cathode surface.

>Which elements do I use? What voltage should I use for the
>blasting? How much filament overvoltage?

Strap all grids, accellerators, deflectors and anode together so they act
as one 'virtual anode'. Apply between 10 and 25% filament overvoltage for
a couple of minutes (gets cathode real hot and 'burns off' some of the surface
emmissive material), then fire current pulses of 5 to 10 times the usual
cathode current through the thing (between the nicely glowing cathode and
the rest of the electrodes strapped together). If you put a meter in the
'anode' line, you will see when youve done the trick since the current
you get on the peaks will rise. I use about 400 volts at up to 100mA for this.

2745. Meteor Communication

Newsgroup: rec.ham-radio
Date: 1989-09-20 11:36:22 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <8909201136.AA07358@cmr.ncsl.nist.gov>
Source record: 16865

First I unload a minor complaint and then make a useful (?) comment.

1. It's fair to say that burst-type meteor communication is mostly specular reflection from the ionized trail of the meteor, not scattering from sub-critical ionization. Thus the term meteor "scatter" is usually used incorrectly (see below for exception). The term meteor "burst" is more descriptive.

2. There have been a number of "demo" and real applications of meteor communication. For a couple of real examples:

The Dept of Agriculture has had a meteor-burst network in the northwestern states for a number of years. It collects snow-depth data.

Alascom, the Alaskan telephone system, uses meteor ** scatter ** to serve some of their outlying areas. This involves high power and big antennas to get CONTINUOUS voice communication. My old bosses called this mode ionospheric scatter - but there is certainly a meteoric contribution.

I have on the desk beside me a ball-point pen given away by Meteor Communication Inc, Kent, WA. They make a business of meteor-burst communication; no endorsement given.

3. I built a full-duplex teletype meteor-burst demo system back in 1955-58. I've also worked W0RPK with packets on six meters using meteors - see recent ARRL Handbooks.

4. As you doubtless know, there is a lot of DX-type communication on 2 meters using the BIG overdense bursts which occur during the main meteor showers.

2746. The 2010, for davids@truevision....

Newsgroup: rec.ham-radio
Date: 1989-09-20 12:22:47 UTC
From: philiph@kean.mun.ca
Message-ID: <17088@kean.mun.ca>
Source record: 16866

I am posting this because my letter to davids@truevision.com keeps
getting returned with an "unresolvable address".

Dear David,
Yes, I've had some trouble with the synchronous detection on
my Sony 2010. Since I would rarely use it anyway (or so I think now!),
I've never had it looked at. My problem is almost identical to that
experienced by someone on the net: only one sb seems available in the
synch mode; in my case it's the USB. I have had a lot of trouble over
the years with the level of service from local Sony reps (with waits of
up to nine months for service of my old Sony ICF6700W), so that also
makes me hesitant to have it looked at.
But it is a good radio on shortwave. My set is terrible on
mediumwave - when checking out the am band I use my little pocketsized
Panasonic five-band, single-conversion radio (RF-085) instead of the 2010.
The 2010 is best for the convenience of having so many preset memories.
I don't usually do a lot of 'dxing'; instead I rely on sw for access to the
BBC, until a year or so ago the AFRTS, and so on. Those preset memories
make it easy to get them.
The sound, as you might expect from a radio its size, is not
great, but surprisingly good -- on fm the stations sound better than on most
mediumsized boomboxes I've heard.

If you do get one, check out its synch circuit first thing!

Good luck,

-Philip

2749. Hugo and Good Image of Ham Radio

Newsgroup: rec.ham-radio
Date: 1989-09-20 13:35:27 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <8909210712.AA01131@ucbvax.Berkeley.EDU>
Source record: 16873

The local St. Louis TV coverage of Hugo has included a *lot* of mention of and praise for ham radio operators, including some of the usual "picture of a man sitting at a radio desk" and "picture of a hand on a tuning knob" type of coverage -- it may be trite, but it has all been very positive. I noted several times that the anchorpersons, in the usual post-story "chat" scenes, made positive comments and expressed admiration for ham operators for their role in emergency communications during this situation.

I don't know if this degree of accurate and positive coverage is due to the presence of hams on the staffs of the TV stations, or promotion by local ham clubs or organizations, but, whatever the cause, it is working!

There was also a pro-ham article in the St. Louis Post-Dispatch.

Right after this emergency situation is resolved, when the memory of a positive image of ham radio is fresh in the minds of editors and newspeople, would be a good time to present them with the ham's viewpoint on the recent anti-ham actions of the FCC, such as the 220 fiasco. If it isn't done in a heavy-handed manner, but instead presented as "background" for an issue that might arise as newsworthy (in their opinion, not just in ours) in the future, due to the continued court battle over this subject, it would tend to predispose future coverage of the issue to be pro-ham instead of anti-ham.

Local antenna-rights and zoning issues can be addressed in the same way. If the local station or paper praised hams' actions in this case, they can be gently informed that local governments or boards are reducing the capacity of the local ham community to perform such services by either driving hams away via restrictive zoning or covenants, or limiting their capabilities by restricting antennas.

Regards, Will Martin

Message-ID: <8909210712.AA01163@ucbvax.Berkeley.EDU>
Source record: 16875

Yep, it's for real. Last week's edition of the SWL Digest program on Radio Canada International had an interview with an engineer who works with (or runs -- not sure) a company that produces meteor scatter commo gear. The seismic sensing application was also briefly mentioned. I believe the specific example they described was a tsunami (tidal wave) warning system for the Pacific coast.

2752. TS830S Analog Dial

Newsgroup: rec.ham-radio
Date: 1989-09-20 14:39:03 UTC
From: brosen@bbn.com
Message-ID: <45824@bbn.COM>
Source record: 16876

The instruction manual for the Kenwood TS830S describes the simple procedure for calibrating KHz tick mark ring that is on the outside edge of the tuning knob AND the procedure for calibrating the digital readout. It says nothing about calibrating the analog readout, however. Can I do this without major surgery? It's annoying to have the digital and analog readouts be out of synch. Any pointers would be appreciated.

2753. Re: Meteor scatter goes commercial

Newsgroup: rec.ham-radio
Date: 1989-09-20 15:03:35 UTC
From: glenne@hpnmdla.HP.COM
Message-ID: <1250071@hpnmdla.HP.COM>
Source record: 16777

It seems like every couple of years lately someone
announces that they are the first to use meteor
scatter for digital communications.
Besides amateur use of the mode for a *lot* of
years, the military used a combination of troposcatter
augmented by meteor scatter at low vhf to island hop
the pacific. I believe this is the same sort of
mechanism the early-Saturday-morning 6M crowd uses to
work 1000-1500 miles routinely. Early morning is an
advantage because the earth sweeps up small space
dust at the greatest rate. This "sub-meteoric" stuff
ionizes sufficiently to make a sort of "noisey" path.
It works fine for SSB and CW. I expect for high digital
information rates the modulation technique needs to
be chosen with care.

From: rshapiro@bbn.com
Message-ID: <45830@bbn.COM>
Source record: 16778

I'm considering proposing a new group for SWL's (Short Wave Listeners) as opposed to hams. But before doing that, I thought I'd ask a few questions here (the existing newsgroup which seems to be closest):

1) Are SWL postings welcome here or would that be considered noise by most regular readers? Is this group exclusively for ham news, or is it just that ham posters post much more often than swl posters?

2) Are there a significant number of readers here who might like to see such a separate group? Or, on the other hand, would you rather see this kind of news kept in this group?

3) Has someone proposed such a group in the recent past?

I don't want to get a big discussion going here, so why don't you email replies (rshapiro@bbn.com) instead of posting them. I can summarize (if there's interest), and then either begin the process of proposing a new group, or begin posting swl articles on this one.

Thanks (and apologies if you've been through all of this before).

Richard Shapiro / rshapiro@bbn.com

>make a practical HF receiver, using the DSP for most of the selectivity, gain
>control, and demodulation? Is it reasonable to use that low an IF? Could you
>use both ADCs on the chip to alternatively sample a higher IF, like 160 kHz?

For one thing, if you have a fast enough sample/hold, you only need to
insure that the IF bandwidth is less than "80 kHz or so" -- you use
aliasing on purpose in this case. Sampling is very closely related to
mixing.

2756. Re: Squint angle? and AO-13 performance

From article <793@soleil.UUCP>, by gopstein@soleil.UUCP (Rich Gopstein):
>
> The question is:
>
> In an elliptical orbit, what is the orientation of the satellite as it
> moves through a single orbit. Is the axis of the satellite always
> perpendicular to the orbit, or is the axis always pointing through the center
> of the earth? Or is it something totally different?
>
> Rich, KD2CQ
> .

Rich:

Think of the attitude of the spacecraft as FIXED in space. Think of the
antennas as pointing at some star in the distance. For the purposes
of this discussion (neglecting minor gravitational anomalies) the spacecraft
always points at this star as it goes about its orbit. It doesn't roll around
the orbit and it is spun about the antenna axis to provide a `gyroscopic'
stability. During the best times, the antenna will be pointed at the center
of the earth ONLY at apogee and will point exactly away from the center
of the earth at perigee. In between, you are looking a various off pointings.
The Squint angle or pointing angle as James Miller, G3RUH and I respectively
called them in our popular tracking programs, is exactly what you guessed,
it is a fancy name for the angle the antennas make with your location.

Hope this helped,

Bob McGwier N4HY

I sold my fancy radio (TS440S) last June. No time or antennas so it was just sitting on the shelf. Last weekend I picked up a Uniden HR2510 at the Hi Plains hamfest in Wyoming. Using it in my pickup with a cut down CB whip has been a blast. The first qso was East Germany. That day I also worked Florida, Mass, Pa, Vermont, Md, Japan, Alaska and Tasmania. It was fantastic. I hadn't had so much fun in radio since my novice days.

Since then I've also worked Maine from my bicycle and Alaska from the top of a 8000' natural tower (mtn) west of town. Backpacking with a radio, battery, solar panel and dipole is hard work but still really neat.

Congrats again.

+He was saying that the sensors gather data waiting to hear something
+on a certain freq (I don't recall if he said it was noise caused
+by the scatter or if they used the scatter) and then sent the
+data in a burst using the scatter (since it was there 'cause they
+received via scatter). Sounded legit to me. Does anyone know more
+info? If this is for real, then it is already commercial.
+Glenn AA6ER

I read an article somewhere recently where the military had been studying this method of transmission since it was conceived in the 1920's. It is being considered as a method of communication in the event of a nuclear attack. I suppose that a message is sent in such a way to blitz its way through the charged atmostphere to get to the meteor trail.

Apparently, messages are stored at individual sites (not a central site, branched out) since an ionized trail lasts for milliseconds. A message must be shot off immediately. This can lead to overlap, but is easy to overlook.

There is some kind of tracking system (probably similar to how lightning is tracked) that scans a small portion of the sky searching for this trail, and the message is sent in a burst.

I kinda doubt anybody but the military has anything going in this area right now. I could be wrong.

2759. Cleaning Tape Heads

Newsgroup: rec.ham-radio
Date: 1989-09-20 17:31:16 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <167285@Wayne-MTS>
Source record: 16783

Oddly enough, more than one recording studio engineer I talked to back
when I was running a rock and roll music store recommended plain old
lighter fluid for cleaning tape heads and other componants in the tape
path. This is nothing but good old Naptha, aka Energine Cleaning Fluid.
I've used it since, with no ill effects. It doesn't cause the rubber
to dry out as alchohol does. Do we have any solvent experts who can comment
on the wisdom of this practice?

2760. rec.swl? no need.

Newsgroup: rec.ham-radio
Date: 1989-09-20 18:51:15 UTC
From: rshapiro@bbn.com
Message-ID: <45861@bbn.COM>
Source record: 16784

In article <45830@bbn.COM> I wrote:
>I'm considering proposing a new group for SWL's (Short Wave Listeners)
> [etc]

Apparently this is an old topic that re-surfaces from time to time. I got a number of responses almost immediately pointing out that (a) swl postings are welcome here; (b) there's not much swl traffic; (c) the internet gateway (info-hams?) wouldn't be available for a new group; so (d) an swl newsgroup wouldn't be very useful and isn't really needed.

Thanks for all of the (very prompt) replies.

R. Shapiro

>enhancement (that DID NOT bring significantly more new operators in, and
>is bad in that it removes incentives for upgrading), and (3) promoting a
>code-free VHF license (which I predict also WILL NOT bring in a
>significant amount of new operators:

No, No, that's not right. The ARRL has been trying to destroy amateur
radio by forcing incentive licensing on us in the 60's and not promoting
no-code licensing in the 70's. I know because I have been reading Wayne
Green's columns for 20 years and that's what he says.
As for (1), its all Ham Radio Magazine's fault for reducing the technical
level of their articles. QST was always too full of DX columns, contest
stuff and pages and pages of district representatives to leave much room
for technical stuff.
Really though, let's leave the poor ARRL alone these days. They're about
broke anyway.

You might also check to see if a radio not designed for the U.S. market complies with the FCC's incidental radiation restrictions on receivers. Some do; some don't.

In article <13900010@m.cs.uiuc.edu> kenny@m.cs.uiuc.edu writes:
>The antenna pointing information is given in the AO-13 schedule with
>the BLAT and BLON parameters (Can someone give me an idea how to
>interpret these? Is longitude relative to the ascending node, and
>latitude relative to the orbital plane? I speculate this because BLAT
>is nearly always zero and BLON is close to the argument of periapsis.)

The BLAT and BLON (short for "bahn latitude" and "bahn longitude",
respectively), are given with respect to the satellite's orbital plane.
("Bahn" is German for "path" or "track"). The longitude indicates how
the spin axis is rotated within the orbit plane, and the latitude
indicates how far it is tilted out of the plane. Originally, the idea
was to specify BLAT/BLON = 0/0 as nominal; i.e., with that orientation,
the antennas would be pointed in a direction that is parallel to the
spacecraft's position vector at perigee. This results in the antennas
pointing directly at the center of the earth when the spacecraft is at
apogee. However, the spacecraft software was written with the
expectation that the spacecraft would spin counter-clockwise as seen
from the antenna side, yet both AO-10 and AO-13 spin clockwise (AO-10
because of the recoil from the launcher collision, and AO-13 because the
spacecraft was mounted upside down during launch). Rather than change a
sign in the software, DJ4ZC opted to reverse the spacecraft coordinate
system so that the motor (bottom) side is the reference rather than the
antenna side. Hence the nominal orientation is now blat = 0, blon = 180.

>The antenna design aboard AO-13 has a significant sidelobe at one
>particular range of obtuse squint angles; it escapes me at the moment
>what angles these are. Phil, can you get this information?

I don't have a complete antenna pattern; I'm not sure that one exists.
However I can say that the antenna has a significant amount of assymetry
off axis, which is why you get spin fading for large "squint angles".
Much of the fading is due to polarization reversals; I've noticed that
if you switch polarization on your antenna, you'll still hear fades but
the signal strength envelope is different and displaced in phase.

Phil

>Thanks, Phil. Does this mean that those of us with tracking programs that
>don't figure squint angle (like MacTrak) can use a simple table relating MA to
>squint angle, at least when the antenna is not off-pointed?

Well, sort of. You can certainly approximate the value easily enough, but
remember that the earth is not infintesimally small as seen by the satellite,
so not all stations see the same squint angle at all times. At apogee, when
the earth appears smallest, this effect is minimal but at other times when
the satellite is closer the parallax errors are greater.

It's actually fairly easy to compute squint angle internally in most
tracking programs since most of the necessary information is already
available as a side effect from computing the az/el/range figures.

Actually, you'll want two mixers, low pass filters and A/D converters.
The mixers should operate in quadrature so you can do things like SSB
filtering in DSP software.

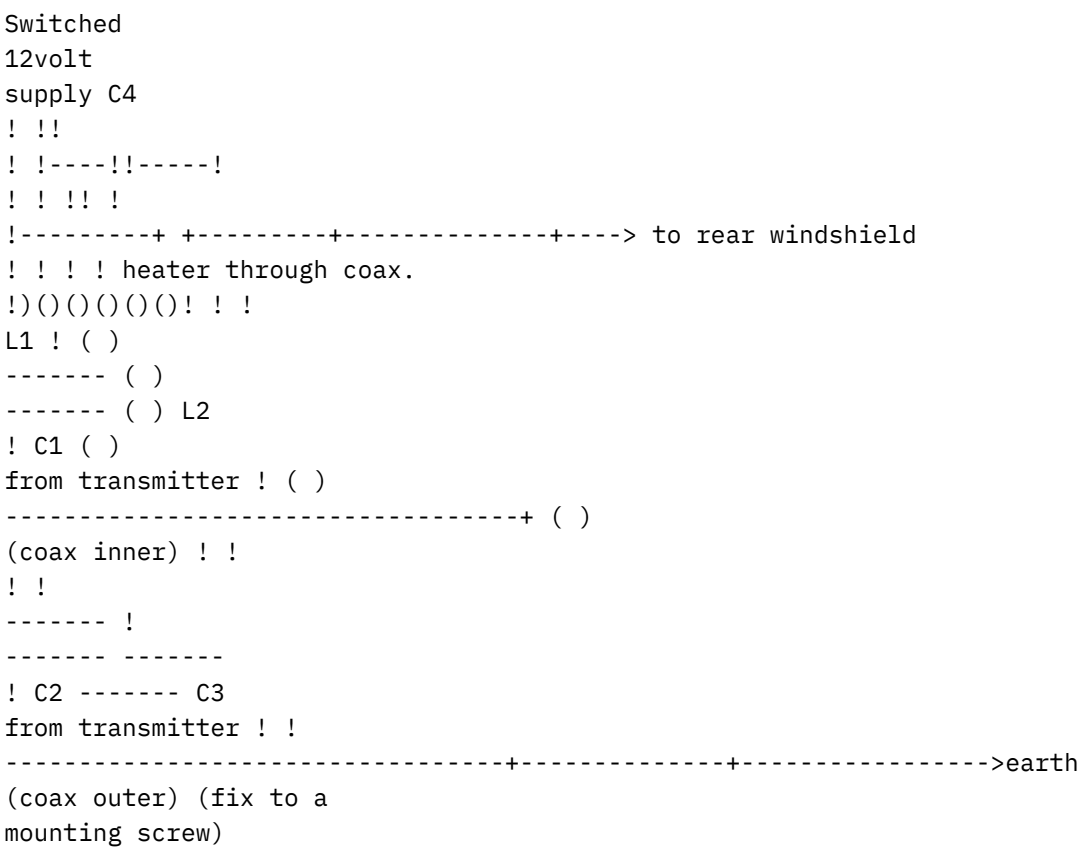
Heated-rear-screen antenna part 2 - the matching network.

Try it - you may be pleasantly surprised.

Apologies for the delay in posting part 2: the Data Loss Monster had
taken up residence in one of our mailers, so here it is being posted
again for those who missed it the first time!!

Matching network.



Apologies for the sleazy diagram - its the best i can do in ASCII, and
not all of you will have PostScript.

C1 and C2 are 100pF airspaced variable capacitors
C3 is 1000pF 1kV ceramic or silver-mica
C4 is 4.7pF 1Kv ceramic or silver-mica.
L1 is 250nH (9 turns 16 gauge enamelled wound on 0.25 inch former)
L2 is 55nH (3 turns 16 gauge enamelled wound on 0.25 inch former)

Connect the output to the heater element with a 1/2 wavelength of coax
(remember to take the velocity factor into account).

I dont recommend using more than 25 watts to such an animal, otherwise the
field strength for rear-seat passengers may be a bit too high for safety.
Look up reference (4) if you are worried on this score, or see what
your national standards recommendations are.
Tune the thing up either using a forward/reflected power meter between the
transmitter and matching network (dig out that Bird 43?) or a field strength
meter located at least 10 wavelengths away. Remember that lowest SWR does
not necessarily correspond with highest radiated field strength.
Make sure that all the doors of the vehicle are closed while you are tuning up,
as there can be quite a change of resonance when you open the doors!
If you have a rear screen-wiper, try the effect of removing it. Some
of the wiper arms are metal and can have spurious resonances. If theres
a notable difference, try and get a plastic wiper arm from your dealer.
The Police and security services in the UK are using such antennas for
their surveillance vehicles. Because they operate split frequency duplex
(with sometimes a 15 or 30MHz split) they use two matching networks and
a RF-sensed relay changeover between the networks. Typically they use
between 15 and 25 watts of transmit power.

2775. Meteor Scatter

Newsgroup: rec.ham-radio
Date: 1989-09-21 12:40:55 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <8909220706.AA18120@ucbvax.Berkeley.EDU>
Source record: 16800

It's been nice to read so many notes on meteor scatter,
especially from W3OTC who has had first-hand experience
with it. One small point has been raised a couple of times:
Echo/burst durations are much longer than a few milliseconds.
At 49 MHz (a common meteor scatter [or burst] frequency),
signals last several seconds. Currently, most systems use an
inquiry-response approach; the "originating" station listens until
it hears a beacon sent by the "receiving" station (thus indicating
that the path is open). The "originating" station then sends its
pseudo-packet message pronto, hoping to take advantage of the same
open path. Perhaps the "milliseconds" reference was in regards to the
turnover time between receipt of the beacon signal and initiation of
data transmission [I dunno].
In any event, the military and several commerical outfits have been
using MS, combined with ionospheric forward scatter, for a long time.
The so-called "new advances" periodically announced, such as GTE's
digital voice system using MS, are enhancements on the same basic
process that was well established in the mid-late 50's.

For those of you looking for a multi-band antenna, R-S has just come up with
a DISCONE in the $60 range.
Frequency coverage : 100 - 1300 MHz
Transmit power : 200 watts max
Mfr's SWR estimate : 1.5:1 or better
Transmittable bands: 144, 220, 440, 900, 1270 MHz

The unit consists of a central machined piece with SO-239 (standard 50 ohm
connector) built in. The center piece is threaded for eight sloping radials
(the CONE part) and eight horizontal radials (the DISC part). The radials
are threaded and cut to length already.

There is a "jam nut" for each of the radials to hold it securely to the core.

An aluminum tubing piece slides over the SO-239 [so you have to attach your
coax first, then bolt the thing in place] :-(

Two clamps and U-bolts are provided to clamp that tubing to your mast.

The whole thing goes together with one phillips screwdriver and a small
adjustable wrench for the "jam nuts" and for the U-bolts.

It takes about 10 minutes to put together. Maybe quicker, if you're not watching
TV.

DOCUMENTATION: none to speak of. Parts list. Diagram. Safety (hi voltage
warnings, etc.) that's about it.

ON-THE-AIR PERFORMANCE: To be determined. I need to get my SWR bridge out of
the field day box and see if it lives up to advertisement. I've had the thing
all weekend on my Packet Mailbox, and my TR22/C hasn't exploded. I've heard
some things I don't think I heard before (but all I got to compare is a
mag-mount 1/4 wave mobile whip!)

I'll add significant performance reports as they become available!

73,

Bob, WA8YCD

I don't think so. You should be able to do that in the DSP with a single
ADC. After all, the signal into the ADC is identical to that off the
antenna except that it has a lower carrier frequency.

2779. Re: Motorola HT's

Newsgroup: rec.ham-radio
Date: 1989-09-21 13:54:14 UTC
From: brian@ucsd.Edu
Message-ID: <10020@ucsd.Edu>
Source record: 16804

The HT-200 is the famous "brick" that was popular in ham circles around 1970 or so when I first got into 2m FM (back before the ARRL invented it).

They have a dual-conversion receiver that hears pretty well but is prone to overload and cross-modulation; you'll have a bit a trouble with one if you live near FM or highband TV broadcast transmitters, or near a bunch of two-way stuff. They were practically useless on the mountaintops where all our repeater stuff was, at least around lunchtime.

The transmitter is of either of two models: the H23DCN was about a 1.5 watt radio and used three incredibly-expensive PNP germanium transistors in the final; it would blow them at the drop of a hat and 10 years ago they cost $25 apiece to replace. There was no substitute. The H23DEN was a later transmitter and had much more rugged transistors, it also put out almost 2.5 watts on a good day. Neither transmitter was known for its spectral purity; talking on one in a building full of repeaters was sure to gain you some enemies because of all the desense you caused.

The battery is a custom Motorola job; they used to cost $50 or more and may not even be available any more, but you can rebuild them out of standard NiCad cells. As with all Motorola walkies, it'll run for a full day off one battery charge if you don't gas too much. The radio is POSITIVE GROUND, so don't try to run it off your car's electrical system!

These things are LARGE and HEAVY. They are about 8 inches high, about 4 inches wide, and about 1.25 inches thick. They weigh nearly 4 pounds. They are, in fact, just about the same size and weight as a standard construction brick. They're just about as rugged, too; they have a thick Cycolac plastic moulded housing and a cast aluminum back cover. The Motorola salesmen used to demonstrate how rugged they were by pounding 16-penny nails into pine with one; the local police used to demonstrate how rugged they were by pounding demonstrators and drunks into the pavement with them. I've seen more than one come into the radio shop with blood and hair stuck to the case. I also saw one with a deep gash across the battery compartment; it had been used to chock a railway freight car. (that one didn't fail until it got dropped into a puddle; the water got in through the gash and shorted out something inside.) My highband one fell out of my back pocket while I was about 75 feet up a tower and still worked, although the doggy-dick antenna never again was the same.

They are one-channel receive, usually, although some were equipped with a piggyback board to make the receiver two-channel. I think the transmitters could all do two-channel. If you wanted remote speaker/mic and/or subaudible tone ("PL"), the walkie grew an inch in height to fit

the switching relay and tone deck in.

The circuit boards are thin glass-epoxy with rivets through the holes; they are an A-number-one bitch to work on. There are parts buried beneath other parts, and parts on the back side, and everything is tiny tiny tiny. And hard to get.

Oh yeah, if you short out the earphone jack while someone is talking, or blow the squelch, you'll ace a complementary-pair of germanium transistors in the audio output stage. They will short and burn out the micro-fuse. $15 each time.

If you can get a working high-band (150MHz) model with a good battery for $50 US, it might be worth it. It's quite a museum piece nowadays.

Oh yeah, the 30-50 MHz models were better. The 450 MHz models were worse. I have one of each.

Motorola will sell you a reprint of the microfilmed manual for some modest fee. You'll probably have to contact their USA parts organization to get it.

Have fun!
- Brian

2780. Re: Meteor scatter goes commercial

Newsgroup: rec.ham-radio

Patty,
The length and duration of meteor bursts depends on
all sorts of things as I remember. Different showers have
different characteristic particle sizes and behave
differently. Short .5 - 2 second pings are common but
I remember the 1967 Leonids shower which had single
trails useful for a minute or more (I stayed up all night
working stuff and had to get a very interesting note to
excuse my absence from high school the next day (:>))
The dust that is useful around 50 MHz just sort of
raises the background signal level up to the point of
being useful.

Acknowledgments may not come for minutes or hours after
call sets have been exchanged!

2781. sell radios to the unlicensed

Newsgroup: rec.ham-radio
Date: 1989-09-21 15:26:03 UTC
From: plymate@noao.edu
Message-ID: <1185@noao.UUCP>
Source record: 16806

It is FINALLY time for me to add my $.002... This is my first try at posting, so I hope it works.

I have been after a good friend of mine for quite a while to get his ticket. At a swapfest a while back he decided to buy a handy-talky (That's right, without a license!). He asked some of us our opinions and we encouraged him to buy an IC-u2at. We thought this would give him the motivation to learn the code.

Last night, while on his way to work he came upon a traffic accident with injuries. He tried to use his CB to get some help, but couldn't get a responce. Reluctantly, he picked up the Handy and tuned it to a repeater he has been listening to and gave a call for help. He (of course) got a a ham to reply and got the appropriate authorities notified. His actions might have saved a life last night.

I'll leave it for you to decide if this nonlicensed person should have had that radio with him last night...

2782. JRC NRD525 opinions wanted

Newsgroup: rec.ham-radio
Date: 1989-09-21 15:58:00 UTC
From: SS@S47.Prime.COM
Message-ID: <386400005@S47.Prime.COM>
Source record: 16807

[and still I wonder...are there really any line eaters out there...]

I am considering the purchase of a Japan Radio Corp NRD-525 receiver (or perhaps a used NRD-515 if I can find one :-)). I'd appreciate hearing from anyone who owns or has used a `525 or `515 on positives and negatives of them. I'd also appreciate any leads on where to get one for less than list price, and whether or not people think they're worth the large wad of bucks. Perhaps those who own the ICOM R-71 or Kenwood R-5000 might reply as to why they selected those models over the JRC ones...

A little context on this.... I'm looking for an excellent general coverage HF receiver for AM and SSB mostly, but who knows..maybe I'll get into FAX, RTTY, or CW some day. It would be THE receiver to use with my various HF ham transmitters (remember the days when there were separate transmitters and receivers! ;-)) and I'd also use it for SWLing.

Also, are there any synchronous detector add-ons for the `525? (like the Sherwood for the `515) Any opinions as to the whether or not a sync det is really worthwhile?

Replies can be emailed or posted.

>Imagine how fast, cheap ADCs and DSPs could cause a revolution in receiver
>design (especially when we get cheap ADCs and DSPs that can handle several
>MHz IFs, and direct digital synth chips to match)...

I like this approach. I've been waiting for a cheap part for some time --
forget for a moment the use of the chip in post-IF demodulation consider direct
conversion of VLF. A WWVB receiver at 60kHz which is nearly all-digital is
quite possible. No IF needed, the LC tank/antenna coupling at the front end
represent the only analog parts (and reduce multiples of 60kHz to the point
that there are not aliasing/fold-over effects to corrupt the ADC samples).
Then what remains is a fast ADC and fast digital processor, for which 60kHz is
not impossibly fast.

The two other interesting part of the project is that because the time info
modulation is done by carrier phase shifts, one wants synchronous AM detection.
Also, the BCD datastream recovered needs to be turned into ASCII or used to
drive a display. The former is done easily with digital signal processing
techniques, the latter by simple data processing.

I would love to see an inexpensive two chip (ADC+CPU) solution.

2784. New Part 97

Newsgroup: rec.ham-radio
Date: 1989-09-21 16:53:22 UTC
From: gdelong@cvman.prime.com
Message-ID: <8909211653.AA02601@cvman.prime.com>
Source record: 16809

I'd expected to see a lot of discussion by now of the new Part 97
recently published. But, I'm will to kick off the ball with what
I thought was a couple of very interesting sections.

| S 97.403 Safety of life and protection of property.
|
| No provision of these rules prevents the use by an amateur station
| of any means of radiocommunication at its disposal to provide essential
| communication needs in connection with the immediate safety of human
| life and immediate protection of property when normal communication
| systems are not available.
|
| S 97.405 Station in distress.
|
| (a) No provision of these rules prevents the use by an amateur
| station in distress of any means at its disposal to attract attention,
| make known its condition and location, and obtain assistance.
|
| (b) No provision of these rules prevents the use by a station,
| in the exceptional circumstances described in paragraph(a), of any
| means of radiocommunications at its disposal to assist a station in
| distress.

Well, this confirms the previous opinions of most that, in a life or
death situation, anything goes. But for the first time (to my knowledge)
puts it in writing. But this even goes further, it applys to property
and a "station in distress" (That might prove fun to define. I really
am distressed when I don't get fed on time, so I'll call up Pizza Hut
for an order to go.)

I guess now we have a legitimate use for those mods to covert VHF/UHF
rigs to operate in the public service sub-bands. (Should police and
fire departments be advised that we might be coming up on their
frequencies now to report accidents, etc?)

Now, although the parenthetical remarks above may exaggerate the results
of the new rules, I think the issued should be talked about to try to
find some sensible guidelines for complience without excess.

What do "you" think? Can you see yourself at a traffic accident and
the repeater tied up with commuter "how was your day" traffic, QSYing
over to 155.xxx and calling "XYZ PD this is WZ1ABC with emergency
traffic?"

I don't know about you, but I've come very close to doing something like
that in the past. It was around 2AM one morning, someone had controlled

off the repeater user functions, and I'm looking at car on it's side in the woods with people trapped inside. Now this was in southern NH and I finally contacted someone in Conn. via the New England 220 Network who called NH State Police, who called the local police. I think if this rule had been in place at the time I would have ended up talking to the local PD on their freq and having a fun time explaining things to them later.

Opinions/comments?

Source record: 16810

From article <45830@bbn.COM>, by rshapiro@bbn.com (Richard Shapiro):

Great idea, go for it. I vote Yes and support your efforts.

Its a natural to create a separate news group for swl'ing.
I personaling am quite involved with both ham'ing and
swl'ing but, I'm sure there are great number of people
whom are interested in and working only the hobby of
swl'ing. And it also possible that many swl'ers are
not interested in many of the aspects of the ham.radio
news group (e.g. pizza phone patches, 10m taxi's, obnoxious
HF nets) to the point where they might not have even
seen your suggestion and consequently would not respond
to this poll.

Of course there are commonalities including the science
of propagation, HF/VHF/UHF receiver specs and capabilities,
QSL'ing and personal SWL experiences but, the program
material air'ed is probably the greatest difference
and to many the most interesting.

Would it not be nice to hear of a rare DX station that was
copied from your part of the world on a particular time and
frequency. Or a station your use to hearing had changed
their operating frequency and transmission time. Or
maybe the Sweden, Canada, England, Russia, VOA or other
informative international broadcasting station that had a
new program that would be of great interest to many of us.

OK, folks, my mailbox is *flooded* with replies, both for and against. One thing is clear -- this topic needs public discussion on news.groups. Therefore, I plan to formally propose the creation of a new group. After reading through all of the replies so far, I think the proposed group should be generalized to include all kinds of broadcast-band dx'ing, as well as swl'ing (mw, vhf, tv). Name suggestions, anyone?

Many thanks to everyone who responded. Please save further comments for the public discussion on news.groups.

>Does anyone know what the BC-210 uses to back up memory. I doubt that

I had this happen to my 250 some time back. Had to send it to Uniden to
get it fixed - 2 or 3 times (their service sure doesn't come close to
Electra's; too bad they bought 'em out). They ended up replacing the
EEROM chip, and maybe some others - which I believe were custom chips.

Cleared up the memory problem, but it had weak audio with a 60Hz hum
after that. It since gave up the ghost, and Uniden couldn't fix it
because the necessary parts were "no longer available" (Uniden did give
me a limited-time option to choose from several new but roughly equivalent
scanners at about 40% off the list price, though). So, you may be
S.O.L. I'd guess that it's probably barely worth the cost of repair
anyhow - you could probably buy a used one for about what you'd end up
spending.

I bought an Icom R-7000 and love it! It is lacking in some typical
scanner-type conveniences, but I guess you can't have EVERYTHING.

Subject: Hurricane Hugo, DR 013
Time & Date: 12:00 Hrs. EDT 20 September 1989
From: National Red Cross Disaster Services,
EOH and National Weather SVC.

The following is a summary of the report forwarded to me from FEMA.

****

Damage Assessment : Preliminary damage assessment information for Puerto Rico indicates that 3/4 of the island is without power and 1/2 without water. Preliminary estimates of affected on Puerto Rico range from a a minimum of 10,000 to as high as 20,000. Red Cross is training 400 volunteers in Damage Assessment in preparation for a detailed assessment. The assessment is expected to hindered by the difficulty in travel in the eastern area of the island due to the damage. Local civil defense report 80% of Culebra was destroyed. A Red Cross Disaster Specialist in ST. Thomas reported no water and no power on St. Thomas and St. Croix. Preliminary assessment of St.Thomas is 1,000 homes destroyed 2000 with major damage and a large amount of minor damage. The airport at St. Thomas is closed and not expected to reopen for two days. No communications with St.John and no reports.

Mass Care: 24,000 persons sheltered on Puerto Rico on Monday.
St. Thomas six shelters open with 1,000 shelters will be consolidated.
Shelters are expected to continue for a substantial time.

Health Services: Estimate 25 people dead. 12 confirmed on Puerto Rico and 100 injured.

15,000 cots, blankets and comfort kits have been shipped to the islands.

>unused: cq usenet cq cq cq... How about 28.310?

Brian Kantor has suggested (in private email) that 10kHz off of
the 'standard' calling freq of 28.4 might be a good idea. So,
I propose that we use the following 3 freqs, in this order, as
our calling freqs: 28.410, 28.390, 28.310

I will attempt to stay at 28.410 unless there is too much qrm there,
in which case I will go to 28.390, and so forth.

And I like the idea of it being a 'usenet calling freq' rather than a
usenet net.

So, all you silent usenetters out there... Join the usenet un-net
this saturday! Come on, you know who you are (I got a phone
call from a very nice gentleman this week who said he never posts
on rec.ham-radio, but reads it regularly. You and everyone who
reads this forum is more than welcome!).

I will start at approx 1500Z (9am Colorado local time) and continue

2794. gasoline generator info wanted

Newsgroup: rec.ham-radio
Date: 1989-09-21 22:19:07 UTC
From: karn@jupiter.bellcore.com
Message-ID: <17681@bellcore.bellcore.com>
Source record: 16819

Emergency power systems have always been an interest of mine. One idea I have is to use a gasoline generator to charge a battery which runs an AC power inverter. The idea is that the generator would only have to run part of the time, thus minimizing the amount of $#@!! noise you have to listen to. This scheme also makes it easy to take advantage of miscellaneous DC power sources, such as solar arrays.

Another potential advantage is greater fuel economy when the continuous loads are relatively small. Switching power supplies that convert AC to 12V DC operate with efficiencies well into the 90 percent range, and the newer so-called "modified sine wave" DC-to-AC inverters have similar figures. It should be possible to "buy back" these relatively small losses, plus the battery storage loss, by periodically running the gasoline generator to charge the battery at whatever load maximizes the generator's efficiency. Does anyone know what the efficiency-vs-load curves are for a typical gasoline AC generator? Just a few points would be very useful, e.g., fuel consumption at no load, full load, and whatever the peak efficiency load is. Sears sells three models, but they only give fuel consumption figures for half load and only for their two larger models (2.4KW and 4.0KW). They work out to a little less than a quarter gallon of gasoline per kilowatt-hour, with the larger model being slightly more efficient.

I'm also looking for general recommendations on generators. I place a premium on good mufflers...

Phil

2795. rec.swl

Newsgroup: rec.ham-radio
Date: 1989-09-21 22:20:51 UTC
From: rshapiro@bbn.com
Message-ID: <45930@bbn.COM>
Source record: 16734
Cross-posted to: news.groups,rec.ham-radio

The following has just been announced on news.announce.newgroups.
Discussion should be carried out on news.groups ONLY -- not on
rec.ham-radio and not by email. A call for votes will be announced
three weeks from today (12-November).

I would like to propose a new group with the tentative name "rec.swl".

Purpose: to discuss issues of interest to short wave listeners, i.e.
those who are interested in listening to programs on the shortwave
broadcast bands; also to discuss issues of interest to dx'ers working
other broadcast bands (vhf, mw, tv).

Topics might include (but would not be limited to):

announcements of programs of interest
program schedule listings
time & frequency changes
magazine & journal recommendations
receiver and antenna reviews and recommendations
dx'ing tips
news of pirate and clandestine stations

The obvious question is: why not use rec.ham-radio for this? The
answer (or an answer): rec.ham-radio is *heavily* dominated by topics
of exclusive interest to hams (i.e. amateur radio broadcasters), and
while many hams are also swl's, relatively few swl's are hams. For
this reason, rec.ham-radio holds little appeal for typical swl's. They
don't read rec.ham-radio, and in consequence they don't post there
either. This lack of participation by swl's in rec.ham-radio should
NOT be construed as proving that there isn't interest in this subject.
After considerable discussion with other swl's, I've come to the
conclusion that rec.ham-radio is not the appropriate forum, and that
another, separate group should be created. While there would be some
overlap between the two groups (and thus cross-posting) I believe it
would be minimal.

Since may swl's are also interested in non-shortwave broadcast bands
(specifically medium wave, vhf-fm, and television), I would also like
this group to include articles about dx'ing these bands (articles
about programs on these bands should go elsewhere, however). For this
reason, the name 'rec.swl' might not be the best one. Other
suggestions are welcome. Possibly "rec.broadcast-dx"?

Definitely! With the additive proviso that scanners and scanner dxing be
included in the official charter, that hobby being closer to swl than it is
to ham.

Much as I like the ham folks, wading through ham-specific postings (especially the continual code/nocode flamewars) gets really tired after a while, and while there are a number of swlers out there (like myself, for instance) it's essentially impossible for us to keep a conversation going through the noise of rec.ham-radio.

>antenna except that it has a lower carrier frequency.

Not necessarily. I assumed that the mixer just before the A/D converter brings the signal down to baseband, i.e., it operates as a "product detector". If there is no filtering ahead of this point, then you won't be able to provide sideband selection in DSP; the necessary information has been lost in the detection process. Two quadrature detectors would be necessary to retain this information by providing complex-valued samples instead of real-valued ones.

You would be right, however, if the mixer only brought the signal down to another IF, leaving the final detection-to-baseband operation for the DSP program. This is of course theoretically possible but it GREATLY increases the speed requirements for the A/D converter and the DSP engine over those that are truly necessary for the signal bandwidth in use. For example, let's say you want to demodulate SSB from an IF of 50 KHz using the single A/D approach. Your A/D converter would have to sample at over 100 KHz. The DSP chip would also have to operate at this rate, if only to do the two multiplies for the final complex detection to baseband. If, on the other hand, you use dual analog mixers and A/D converters, then the anti-aliasing LPF filters ahead of the A/D converters could cut off at only 3 or 4 KHz, and your A/D converters and DSP chip would only have to work with a 6 or 8 KHz sampling rate.

Yes, at some point DSP and A/D chips will become so fast and so cheap that we won't have to worry about such inefficiencies, but for now the quadrature detector-dual A/D approach is more practical for the relatively narrowband signals we deal with.

2799. Sony 2010 replies summarized.

Newsgroup: rec.ham-radio
Date: 1989-09-21 23:52:00 UTC
From: robert@arizona.edu
Message-ID: <14175@megaron.arizona.edu>
Source record: 16821

A while back I asked owners of the Sony 2010 shortwave receiver to comment on my experience with one I had just bought. It would not seem to lock on the lower sideband using its synchronous detection circuit, and I wasn't all that impressed.

After reading the responses (which I have included below), I returned it to EEB for a refund instead of a replacement (which they were willing to do even though they have a stated policy of requiring a 20% restocking fee).

The following is posted for those who may be considering purchasing one of these machines. I will reconsider buying another, but I want to be able to try it out and see it do its thing correctly before putting my plastic on the line again.

/* - */

From flash%lopez%clmqt.uucp@sharkey.cc.umich.edu Sat Sep 9 01:15:28 1989

Robert, something is WRONG with your receiver. I suggest you return it for another.

I have had my Sony 2010 for three years, and am totally satisfied, and find the synchronous detection to be a huge asset. Like you, I care more about the content of broadcasts, and the sony does a wonderful job of picking up strong stations like BBC and giving me the same quality as if the station were a LOCAL. No selective fading, and I NEVER heard any growling except when the batteries needed replacing. Running on the power pack the set provides continuous clean reception.

I can only sympathise with your disappointment but trust me the problem is not in the design of the receiver.

The problem is in YOUR set.

Get it replaced or fixed.

the synch circut is messed up.

From naucse!rrw Fri Sep 8 23:38:32 1989

Hi. Greetings from up here in the Northland. Caught your query on the
ICF 2010. However, I am also looking for information on this unit. It seems
to me that I have seen another posting on this problem ("growling") about
a month ago, but I probably didn't save it...

Anyway, I've thought about buying this unit a couple of times, so I'd be much
obliged if you'd pass along any good information. Also I wonder if you
bought it there locally (where?)...

THANKS!

1) Make sure that you have fresh batteries or the correct AC adapter for the
radio. At least 7 LEDs should light on your Battery Check to make sure. My
sync is the first thing that acts up when the batteries get weak.

2) If you have good power and it growls when tuned within 100Hz of the center
frequency, then you have a malfunction. It is possibly curable by
re-alignment, but if I could I'd return the radio for a fresh unit.

I've loved my 2010 for two years, and regularly use the sync feature for clear
reception of BBC, et. al. for hours on end. Good luck.

I have had one for quite a few months, with no problems whatsoever. No
matter if I am locked into the upper or lower, it stays LOCKED.
I have read a white paper on the 2010, which said that it is
possible to get a lemon. You shouldn't get howling only .1 Khz
from the freq. TAKE IT BACK. -bp

/* - */

From zebra!marc@scicom.alphacdc.com Mon Sep 11 12:46:48 1989

I've used a Sony 2010 for abuot two years now and have been very
happy with it. I've never heard this "growling" noise on mine, I
wonder if something's wrong with it? :-)

Personally, I never use the "wide" filter. It's too wide to be of any
use. The loss of fidelity is sometimes noticeable when I use "narrow"

but it doesn't bother me too much. Now, I use an MFJ "active" antenna preselector and a longwire, so your mileage may vary.

As for the synchronous detection, it is only really of use if used on signals of middling strength (say varying from 3-6 on the signal strength meter). On very strong signals (say the BBC), it does very little, and may even degrade the reception a bit - the only advantage is the enhanced rejection of adjacent signals. For very weak stations (say SLBC or Singapore) the 2010 can't get enough signal for the synch to help, though the total lack of drift is a plus.

But for middling signals, which I like to listen to (say Australian Broadcasting Perth or French Polynesia or Solomon Islands) the synch is a godsend. It really helps get rid of the wooshes and fades and whistles and interference of signals that would otherwise be overwhelmed.

I suggest getting an active antenna, less than a $100 inventment, to see if it helps. (Of course, with the active antenna, you'll always want the "narrow" filter!).

Marc Kenig
"Satisfied 2010 owner"

The growling sound, in my experience comes from low power supply (stale batteries). Try using new ones or better use the AC adapter.

What the Sync reception mode is good for is to eliminate interference affecting only one of the sidebands, usually resulting in whistling. If both sidebands are affected by different sources, all you can do is pick the better of the two. Sync detection is not intended as an improved anti fadding feature. \

Finally, the Sony 2010 and any SW radio for that matter is only as good as the signal in. The whip antenna is insufficient. The wire antenna is an improvement but it's far from perfect. An outside antenna where possible is best. I compromised and use an antenna amplifier and a wire across the ceiling Works great.

/* - */

From olsen@XN.LL.MIT.EDU Tue Sep 12 08:28:00 1989

I recently bought a 2010 and, on the whole, I am pleased with it. I have not experienced the 'growling' problem you describe. (Maybe you could try playing with the RF gain, and make sure your batteries are new.)

The Sync feature is mainly useful for the ability to choose which the better sideband, and not for the increased fade resistance (there is some, but not a whole lot). Also, the 2010 has pretty good sensitivity in the SW bands, and good SSB performance. I consider it worth the extra money.

From wmartin@STL-06SIMA.ARMY.MIL Wed Sep 13 09:41:48 1989

I totally agree with you!

I was the one who posted the question about the Sony "sync" growling a few weeks back. Thanks for the mention that deliberate mis-tuning seems to reduce the growling, or prevent it from starting. I had never even thought of trying that, since, to me, it seems totally wrong to mis-tune if you don't have to to avoid interference. I was brought up to zero-beat all AM signals! :-)

In any case, though, the reputed "reduction of selective fading" sure seems over-hyped for what you end up getting. In most cases, when tuning strong broadcast stations (which is what I mostly use the radio for -- tuning SW stations directed to North America), there is just about no difference in quality between using the "sync" feature or leaving it off.

Perhaps what we need to do is get an authoritative answer on just WHAT "selective fading" causes. This is what I thought was the result of that propagation defect: as you are listening to the broadcast, the signal seems to become subjectively louder, with an accompanying rise in

distortion, making some words hard to understand or causing music to sound unpleasant. The signal then returns to normal.

Is this really the result of "selective fading"? If so, the Sony 2010 "sync" feature does NOT eliminate this, or even noticeably reduce it. I hear the same effect with the "sync" on or off. If this isn't the result of selective fading, of course, "sync" would not correct the problem. In that case, what difference should I be listening for? And, also, in that case what IS causing the audio distortion I described above?

To be honest, the reviews of the Sony 2010 and its "sync" feature leads one to believe that the end result of using it would be that you could listen to strong SW signals with a quality equal to local medium-wave AM. After all, the signal strength is equivalent -- the S-meter reading for SW signals is often *higher* than that for local AM stations. So the only difference left should be the effect of the ionosphere on the signal. The "sync" feature was supposed to largely negate the ill effects of the ionosphere on a strong signal. It doesn't appear to...

Regards, Will Martin

/* - */

From STEVENS@macc.wisc.edu Wed Sep 13 12:58:08 1989

I do not have a lot of experience. But I use my 2010 mostly for reception of the standard broadcast band. (It is the only way to hear any baseball game except the Brewers). I have found that sometimes the synch mode improves things and sometimes it makes things worse. It certainly is not the 'mode to end all modes'. It often does work well on both narrow and broad band AM. I think I have heard the 'motorboating' you mention although when I tried it last night i could not reproduce the problem. The motorboating certainly does occur when batteries are low and the volume is turned up. And rumor has it that the sync mode draws more current from the batteries. I did not think to try that last night; I was using the AC adapter.

My batteries are ALWAYS low. My radio conks out when the batteries get a little low but are still plenty good to run a flashlight. I think this is either a design flaw or a flaw in my radio. I cannot use rechargable batteries at all.

/* - */

From uunet!rutgers!dptg!att!mtuxo!lzfme!ralph Wed Sep 13 11:35:36 1989

Are you running off AC power, or batteries? The only problem I've heard of with the radio consistently shifting into growl is when the batteries are low. I run mine off AC, and I very rarely have the problem (although this particular morning just happened to be an exception....)

Good luck.

Can anyone help me?

A good friend is a California State Policeman and ham operator, not having access to the net, he has asked me to post this for him.

Since joining the force he was issued a GE radio that operates on their (one and only) frequency 460.375. The radio looks like it is years old and has been used by numerous officers before him. He goes on to say that it is only on a good day that he can hit the local repeater.

Asking the dept. what they were/are going to do about this, just resulted with a firm "NOTHING" for a response.

He has now decided to, at his expense, purchase a radio. Being a ham he concluded that it would be nice if he could get a 70 cm (or even better a 2m and 70cm "dual-bander") that would allow him to talk on 460.375 as well as the 70 cm ham band. Please note: (for all ready to send me hate mail) he has proof that he is licensed for both the 70cm band, as well as, the State Police 460Mhz frequency.

DOES ANYBODY KNOW OF A HAM PORTABLE (Kenwood, Icom, Yeasu, etc.) THAT COMES WITH THIS RANGE, OR (MORE LIKELY) CAN BE MODIFIED FOR THIS RANGE?

I heard (awhile ago) that the Kenwood TH-45 could be PLL adjusted so it would transmit as high as 465 Mhz; is there any truth to this?

Any other tricks, tips, or ideas?

Thanks in advance for all the help!
Please send ALL responses to my e-mail address: asplund@castor.usc.edu

Gasoline and Diesel fuel are tough to store for large generators (OK for small ones). Around here I would have to use a double-walled tank for underground or a tank and dike for above ground installation. My home generator (15KW) is dual fueled: Natural gas and Propane. Where I now live, there is no piped gas so Propane is what I use.

Propane is not considered a hazardous material (in the same sense gasoline is) because it vaporizes at Standard Temperature and Pressure.

Another reason not to use gasoline is that it tends to degrade with long term storage, leaving a shellac-like residue in the engine and tank if the engine is not run often enough to ensure renewal of the fuel. Diesel fuel does not have that problem.

It's nice to have enough power to make breakfast while you are operating.

>info? If this is for real, then it is already commercial.
>Glenn AA6ER

A friend of mine, Andy, WA4S, at one time worked for a company
who made meteor scatter radios. I believe that his office in
Miami had one test unit, and another was located in Rochester, NY.
He commented that they were able to pass communications, but I
don't know if his company later marketed the product. Email me
if you would like further information.

I seem to recall reading in Aviation Week and Space Technology
about available meteor scatter radios. They are of particular
interest to the military since widespread use of nuclear weapons
is expected to adversely affect HF propagation.

A while back, I happened upon an interesting report about all this:

Meteor burst communications protocols - the history and role of
computing technology in radio communication via meteor trails
Q. G. Campbell
Technical Report 246
Computing Laboratory, University of Newcastle upon Tyne
November 1987
50 pages

It includes a bit of theory on reflection from meteor trails, some history (dating back to the early 1930's), a summary of civilian and military applications, and some analysis of "data rate adaptive modem" design. The references run to 4 pages, with entries as recent as 1986.

I realize that this report is likely to be rather inaccessible, but many universities with good computer science libraries do have the Newcastle report series. It might still be available upon request from the University as well (University of Newcastle upon Tyne, Computing Laboratory, Claremont Tower, Claremont Rd, Newcastle upon Tyne NE1 7RU, England).

CLUB-SCAN September 1989
^^

Excerpts from the "ANARC Newsletter" plus club addresses & dues.
Distributed by the Association of North American Radio Clubs

^^

Founded in 1964, ANARC's goals are to promote closer ties among radio clubs; to promote the interchange of information and ideas among member clubs; to work for the common good of listeners; and to provide a medium to speak out for radio clubs and listeners in North America. All the clubs forming ANARC are responsible volunteer organizations. No license is needed for the activities our clubs pursue.

^^

All Ohio Scanner Club (AOSC), 50 Villa Road, Springfield, OH 45503 USA
Dues: US $15.00/Canada $18.00. Sample bulletin: NA $2.00/elsewhere
3 IRCs

A phoneline power surge zapped the computer used to produce the bimonthly "American Scannergram." Publisher Dave Marshall has appealed to members of the ALL OHIO SCANNER CLUB for contributions toward a new machine... Topics covered in the AOSC's July/August bulletin include computer-aided dispatching; explaining "amplitude compandered single sideband" modulation; a rundown of recent purchase orders in the Voice of America's modernization; and reviews of the "Nitelogger" recording controller and the HTS-1 audio booster...
^^

Association of Clandestine Enthusiasts (ACE), P.O. Box 11201, Shawnee Mission, KS 66207-0201 USA. Dues: US $16.00/Canada $17.00/elsewhere $23.00. Sample bulletin: NA $1.50/elsewhere 3 IRCs

"Havana Moon" has joined the staff of the ASSOCIATION OF CLANDESTINE ENTHUSIASTS' newsletter to write about "numbers" stations... "ACE" picked up another new editor last month: Andy Yoder's "DX Clipboard" will focus on "short news features on pirate stations and related topics"... The August "ACE" reprints a rebel-rousing flyer from the "Free Christian Patriot Radio Network," and columnist Harry Helms announces publication of his new book, "The Underground Frequency Guide," US$7.95 postpaid from the author c/o 7445 Andasol St., San Diego, CA 92126 USA...
^^

Association of DX Reporters (ADXR), 7008 Plymouth Road, Baltimore, MD 21208 USA. Dues: NA $17.00/elsewhere $19.00 by surface mail. Sample bulletin: NA $1.00/elsewhere 5 IRCs

The Aug and Sept issues of the "DX Reporter" were both chock full of press clippings about VOA and the turmoil in China... In the Aug issue, Bob Colegrove provides useful info about Sony service manuals and repair centers. A consolidated listing of all the foreign LW and MW broadcast stations logged by members of the ASSN. OF DX REPORTERS in the past year is featured in Sept... ADXR needs a new editor for their "Utilities" column. Write, if interested, to Reuben Dagold, 7008 Plymouth Rd., Baltimore, MD 21208 USA...

^^

Canadian International DX Club (CIDX), #61 - 52152 Range Road 210, Sherwood Park, AB, T8G 1A5 Canada. USA $25.00/Canada CN$26.00/elsewhere CN$32.00. Sample bulletin: NA $1.00/elsewhere $2 or 4 IRCs

The CANADIAN INTERNATIONAL DX CLUB held not one but two barbeques this year. While Sheldon Harvey entertained in Montreal, Don Moman hosted 15 people at his home in Alberta. The two groups linked up for an evening exchange via ham radio... Speaking of hams, the 16th annual CIDX Ham DXing Contest is on for 28-29 October... And still speaking of hamness, the "CIDX Messenger's" two amateur-oriented columns are merging. Rob Gerardi now edits both the loggings and DX tips sections...

^^

Club Ondes Courtes du Quebec (COCQ), 160 rue Prieur ouest, Montreal, PQ H3L 1R5 Canada. Dues: NA CN$35.50/elsewhere CN$37.50. Sample bulletin (all in French): NA $1.50/elsewhere 5 IRCs

The August issue of CLUB ONDES COURTES DU QUEBEC's newsletter features Yvan Paquette's report on the Montreal SW Festival; Stephan Blondel profiles R Sweden and R Japan; and Jean-Michel Aubier reviews NASWA's "FRENDX," and the Danish SW Clubs International's "Short Wave News"...

^^

International Radio Club of America (IRCA), 6059 Essex St., Riverside, CA 92504 USA. Dues: USA $25.00/write to club for costs in other areas. Sample bulletin: NA $0.50/elsewhere 3 IRCs

Thirty-four people attended the INTERNATIONAL RADIO CLUB OF AMERICA's annual convention in Sacramento. Highlights of the meeting included a guided tour of KRAK-AM and a Beveridge DXpedition to the El Dorado Hills... IRCA president Karl Zuk has "arranged with the NAB to include our club in the official monitoring" of 1660 kHz for the National Assn. of Broadcasters' anti-skywave antenna test this fall. Karl will explain the NAB's reporting procedure to those who volunteer... Don Erickson has returned as the editor/publisher of "DX Monitor," replacing Bruce Portzer. IRCA dues now go to Don at 6059 Essex St., Riverside, CA 92504 USA...

^^

Longwave Club of America (LWCA), 45 Wildflower Road, Levittown, PA 19057 USA. Dues: NA $12.00/elsewhere $20.00. Sample bulletin: NA $1.00/elsewhere 5 IRCs

The future of the 1750M band isn't nondirectional beacons, according to Randy Seden; it's 2-way digital communications over regional networks. His experiments with packet radio in the LowFER band, reported in the August "Lowdown," show that it's feasible... In the July issue, Sheldon Remington's series "On the Art of NDB DXing" returns with a chapter on beacon idents and formats, and the LONGWAVE CLUB OF AMERICA's propagation editor, Mike Mideke, tells more about natural radio emissions...
^^

Miami Valley DX Club (MVDXC), 4666 Larkhall Lane, Columbus, OH 43229 USA.
Dues: $8.00. Sample bulletin: NA $1.00/elsewhere 3 IRCs

The August issue of the MIAMI VALLEY DX CLUB's featured Dale Vander-poel's report on the ANARC Convention; a reprint of Mark Lucas' forecasts about DXing in the 1980s, published in "DX World" 10 years ago, a look back at how accurate he was, and his predictions for the 1990s; highlights of BBC programmes for the month, and a print-out of Al Quaglieri's latest list of DX shows in English...
^^

Michigan Area Radio Enthusiasts (MARE), P.O. Box 311, Wixom, MI 48096 USA
Dues: NA $7.50/elsewhere write to club. Sample bulletin: NA $1.00/
elsewhere 3 IRCs

The MICHIGAN AREA RADIO ENTHUSIASTS have a DXpedition planned for October 27-9 at Island Lake, Michigan. Contact Don Hosmer, P.O. Box 1193, Dearborn, MI 48121 USA, if you're interesting in going... In the Aug/Sept "MARE Members Newsletter," Kenneth Vito Zichi presents a freq/time list of 50 SW stations whose English broadcasts are easily heard in Michigan, while Paul Dobosz writes about channel use in the VHF aero band...
^^

Minnesota DX Club (MDXC), P.O. Box 3164, Burnsville, MN 55337 USA
Dues: NA $10.00 (membership limited to residents of Minnesota & western Wisconsin).

The next meeting of the MINNESOTA DX CLUB is 7 p.m. on October 13 at the Hennepin County Government Center, Jury Room "A" (300 South 6th St., Minneapolis). Contact Tom Gavaras for details, at 612-544-2433...
^^

National Radio Club, Inc. (NRC), P.O. Box 118, Poquonock, CT 06064 USA
Dues: USA $24.00/Canada $25.00/elsewhere write to club. Sample bulletin: NA $1.00/elsewhere 3 IRCs

Two new editors have joined the "DX News" staff: Al Muick, Jr., will moderate "Musings of the Members," and Dan Bartek, Jr., is reviving the "International DX Achievements" column. In September, Wayne Heinen takes over the "Domestic DX Digest-West" duties of veteran-editor and brand-new-mother Nancy Hardy... Features in the NATIONAL RADIO CLUB's Aug. 21st bulletin include Doug Smith's 17-point plan for improving the AM band, and Cesar Objio's insights about "Holy Week" broadcasting in Santo Domingo...
^^

North American Shortwave Association (NASWA), 45 Wildflower Road, Levittown, PA 19057 USA. Dues: NA & worldwide by surface mail $18.00/ write to club for other areas & airmail rates. Sample bulletin: NA $1.00/elsewhere 5 IRCs

Bob Brown has replaced Terry Colgan as the NORTH AMERICAN SHORTWAVE ASSN.'s ANARC Representative... In the August "FRENDX," Tom Sundstrom reviews the ANARC Convention; Roland Archer describes his portable "DX Shack in a Bag" and reports on his DXing during a visit to Brazil; Ted Benson explains some common enhancements for SW receivers; the Asian Broadcasting Institute provides DX news from East Asia; and the "FRENDX Portrait" column focuses on "Log Report D" editor Wallace Treibel...
^^

Radio Communications Monitoring Association (RCMA), P.O. Box 542, Silverado, CA 92676 USA. Dues: USA $18.50/elsewhere $22.50. Sample bulletin: NA $1.50/elsewhere 6 IRCs

The RADIO COMMUNICATIONS MONITORING ASSN. is considering adopting a custom-designed database program for use by all RCMA editors and members with DOS-based computers. Standardizing would make it much easier to share and update frequency information. A copy of Bob Cheek's program, with a "starter" database of 2000 frequencies, costs US$15 postpaid from R Cheek, 22320 SW 63rd Ave., Boca Raton, FL 33428 USA...
^^

Society to Preserve the Engrossing Enjoyment of DXing (SPEEDX), P.O. Box 196, DuBois, PA 15801 USA. Dues: NA & worldwide by surface mail $20.00/write to club for other areas and airmail rates. Sample bulletin: NA $1.50/elsewhere 8 IRCs

Statements by the 7 candidates for SPEEDX's Board of Directors ran in the August bulletin. Candidate Rich D'Angelo's is sure to spark heated discussion: "There are just too many clubs. SPEEDX should aggressively pursue the subject of hobby club consolidations and mergers"... Ed Janusz's visit to RCI is chronicled in the Aug "SPEEDX," while Kent Willis wraps up his series on audio filtering, and Carl Huffaker serves up a smorgasbord of program notes from his listening-post in Mexico...
^^

Washington Area DX Association (WADXA), 606 Forest Glen Road, Silver Spring, MD 20901 USA. Dues: NA $6.00 (membership limited to area residents)

The WASHINGTON AREA DX ASSN.'s bulletin editor, Jay Goldberg, has a sharp nose for odd news. In June he sniffed out a story about subway vigilante Bernard Goetz's jailhouse job repairing two-way radios for New York City, as well as a short item on the Polish Government's plan to relay RFE on its own domestic service...
^^

Worldwide TV-FM DX Association (WTFDA), P.O. Box 514, Buffalo, NY 14205 USA. Dues: US $17.00/Canada $18.00/elsewhere $27.00. Sample bulletin: NA $1.00/elsewhere 6 IRCs

E-skip came a-roarin' in July, fattening up the WORLDWIDE TV-FM DX
ASSN.'s September newsletter. Fred McCormack's "Western TV-DX" column
was the biggest ever (17 pp.), and European TV waves finally made it
across the Atlantic, tickling Rich Turcsany's multi-standard video
recorder in Stratford, Connecticut... That logging must have shorted-
out John Combs: he's giving up the "Eastern TV DX" column. If
interested in replacing, contact the "VHF-UHF Digest," Box 514, Buffalo,
NY 14205-0514 USA...

2807. Radio Japan DX Host Leaving

Newsgroup: rec.ham-radio
Date: 1989-09-22 08:27:03 UTC
From: rh@well.UUCP
Message-ID: <13739@well.UUCP>
Source record: 16728

While visiting Virginia Beach to speak at the Tidewater Radio Convention last weekend, Kaz Matsuda, host/producer of Radio Japan's "DX Corner," said he'll be leaving the station in November. His assistant, Rika Kobayashi, will take over the show temporarily. But Kaz says "DX Corner" may be dropped altogether next April when R Japan overhauls their English-language schedule.

Kaz's decision to take a job in Australia representing a Japanese resort developer came as a setback to R Japan's plans. Next year's overhaul involves the selection of an announcer to provide live continuity between all the recorded programs throughout the week, to give the station a clear "personality." Kaz was chosen to be that announcer after a series of staff auditions this summer.

His departure means a rethinking of plans. So he says now is the best possible time for listeners who want to influence R Japan's programming to send in suggestions, opinions and comments. Specifically, if you want the "DX Corner" to survive--or to change--now's the time to speak up. Write to Radio Japan, Nippon Hoso Kyokai, 2-2-1 Jinnan, Shibuya-ku, Tokyo, Japan.

Kaz also said that NHK is studying the possibility of broadcasting on shortwave via satellite by the late-1990s. They haven't worked out the technical details yet, but are hoping to interest other countries in sharing the costs, and the airtime. The US and UK have already examined the idea, and decided it would be too costly and difficult.

2808. "Euro DX" Publications Pointers

Newsgroup: rec.ham-radio
Date: 1989-09-22 08:34:19 UTC
From: rh@well.UUCP
Message-ID: <13740@well.UUCP>
Source record: 16729

The August 89 issue of "Euro DX," the European DX Council's quarterly, has a wealth of information about new publications. These pointers, written by EDXC's Secretary General, are quoted with permission:

"The Spanish section of Radio Netherlands have produced the 20th Edition of their List of International Spanish language transmissions. The 36 page booklet contains an introduction section and then there are two sections with transmission details. The first is in time order and each entry shows the time, transmission daily or otherwise, station, country, target area and frequencies. Finally, there is a list of abbreviations used in the booklet, a table of frequencies, time zones and a map showing the various target areas. [rh: Authored by Jaime Baguena Garcia, the booklet is apparently free on request from Radio Nederland, Apartado Postal 222, 1200 JG Hilversum, Holanda.]

"The Danish Shortwave Clubs International have issued the 17th Edition of the well-known `Tropical Bands Survey.' The 36 page booklet covers all broadcasting stations in the frequency range of 2000-5900 kHz and costs surface mail 7 IRC's or 25 Danish Kroner or airmail 9 IRC's or 30 Danish Kroner [from DSWCI, Tavleager 31, DK-2670 Greve Strand, Denmark].

"The German version of the `International Listening Guide' covering the `J' & `S' periods is contained in a 36 page booklet. The opening section is in time order showing both UTC and Central European Time, station and country, frequency of transmission, target area and frequency. There are also details in each time block of news, commentaries and press reviews, and DX programmes transmitted. The final section covers the West German domestic station programming including details from stations in Luxembourg, Austria, Switzerland, Berlin and East Germany.

"`European FM Handbook 1989' 2nd edition, compiled by Timo Leponiemi has 170 pages and is printed country by country. The listing is in frequency order and covers Europe, the Middle East and North Africa. Each entry shows the frequency, transmitter power, station location, type of programme and station address. The cost of this book is 100 Finnish Marks in Europe adn 120 Marks outside of Europe. Orders to Timo Leponiemi, Box 95, SF-04301 Hyryla, Finland.

"The first issue of a new bi-monthly magazine will be published this month called `Radio Bygones.' Each issue will comprise 32 pages covering domestic radio and TV, amateur radio, commercial systems both fixed and mobile, and military, aviation and marine communications from the days of Hertz, Maxwell and Marconi. Features will include articles on restoration and repair, history, reminiscences and just

plain nostalgia together with items on museums and private collections. The publisher and editor of `Radio Bygones' is Geoff Arnold, the former editor of Practical Wireless. Incorporated in each issue will be `The Radiophile' a popular magazine for domestic radio enthusiasts. The magazine will be available by subscription and over the counter at selected museums and specialist outlets. The price of a single copy will be L2.20 or L12.00 for a year's subscription, sample copies of the first issue will be available at a cost of L2.00 by post from the publisher. Further information and subscriptions should be made to G. C. Arnold Partners, 8A Corfe View Road, Corfe Mullen, Wimborne, Dorset, BH21 3LZ, England.

"A British DX Club specializing in Medium Wave listening has a new 20-page booklet entitled "Eleven Years of Trans-Atlantic Medium Wave DX.' The booklet lists every station heard in the UK and Ireland since 1978 and contains details of some 750 stations, with information on the date last heard, callsigns and frequencies - including changes. The cost of the booklet is L1.75 in the UK, with the remittance made payable to Medium Wave Circle. Overseas including postage is L2.00 or 7 IRC's (payable by International Money Order or Giro cheque). Orders to MWN Reprints, 43 Atwood Drive, Lawrence Weston, Bristol, BS11 0SR, England.

"The Swedish DX Federation have issued two new publications, which are only available through DX Clubs, their address is DX Kop, Box 3108, S-103 62 Stockholm, Sweden. `LA QSL List,' 3rd eidtion compiled by Nils Jakobsson, consists of verifications received by DXers in the Nordic countries between 1944 and 1988 from Latin America. The book which runs to 150 pages is in alphabetical country order. Each entry shows the station callsign, frequency(s), station name and address, date started operations and verifications received each year afrom SDXF members. The final part of the book has a list of stations which have changed their name and a list of contributors. The cost of the book surface mail is 75 Swedish Kroner, airmail is additional. *** `List of Latin American Radiostations heard in Scandinavia 1961-1988' compiled by Stefan Bursell. This 126 page booklet is split into four sections, first stations are shown in frequency order, then in alphabetical order, this is followed by a list of LA Clandestine stations, and then country by country with 1682 loggings.

"The Association DX Barcelona have issued a 40 page, 5th Edition, listing transmissions in Spanish. The opening section is in time order and each entry includes the ITU zone, station name, the area of transmission and frequencies. There is a list of ITU countries in the second section and then in frequency order a list of MW Spanish transmitters, followed by a List of DX Programmes. A number of pages then follow with various items of information about station addresses and Spanish/Catalan. The final section is a list of the opening section this time country by country. The cost of the List is 200 pts in Spain & Portugal, 400 pts or 8 IRC's in the Rest of Europe and US$4 or 12 IRC's in the Rest of the World, from ADXB, Apartado 335, E-08080 Barcelona, Spain."

2809. 1990 Vintage Radio Calendar

Newsgroup: rec.ham-radio
Date: 1989-09-22 08:36:48 UTC
From: rh@well.UUCP
Message-ID: <13741@well.UUCP>
Source record: 16730

Christmas and Hanukah will be upon us soon, not to mention 1990. A great gift for yourself or a radio-loving friend is the 1990 Vintage Radio Calendar from Boyce Publishing Co. (P.O. Box 23420, Milwaukee, WI 53223-0420, phone 414-358-2828). I have no commercial ties to this product, except as a satisfied purchaser of their 1988 calendar. I hated to see the year end!

Each month features a different, distinctive receiver, with descriptive comments. The radios are from 1920 to 1950, professionally "posed" and lit. The color printing on slick paper is lush yet subtle. Cost is $11.45 including postage/handling (Wisconsin residents add $.45 per calendar for state sales tax).

2810. Antenna help 4 apartment dweller!

Newsgroup: rec.ham-radio
Date: 1989-09-22 13:15:14 UTC
From: derek@hppad.HP.COM
Message-ID: <3330001@hppad.HP.COM>
Source record: 16731

Hi! I need some advice from some insightful HAMs on how to set up
an effective antenna system. The problem is that I live in a 12 storey
apartment building with no balconies on the seventh floor and I am not
allowed to use the roof for any sort of antenna system. Alas, I sadly
resigned myself to accepting the fact that my HF days were numbered
for now... however, if anyone knows of any other methods or suggestions
for setting up a 20 meter antenna system given the restrictions I listed
above I would very greatly appreciate it! Could a length of wire dangling
out of my window be effective/safe?

One other quick question - I have an old 20m HW-32A which seems to work as
good as ever - however they have an RCA connector on the back for the
antenna connection. Does any one know the easiest way to hook this
up to some RG-213/u co-ax or should I invest in some thinner co-ax?
What kind of feedline was the HW-32a originally intended to feed?

I originally had my heart set on the 80 meter band but I've since lowered
my sights and lowered the wavelength of the band I wish to work on! I hope
there's someone out there who can help 8:)

Thanx!
73's

The September 1989 issue of "Popular Science", page 50, has
a *small* artical about AA sized rechargeable lithium
batteries. Called Molicel2 (should be superscripted, read
Molicel squared), made by Moli Energy. 3 volts per battery.
No address, charging or current capacity given, nor cost.

I would like to find out more, these sound like great
batteries for handhelds. Does anyone know anything
about these?

Thanks in advance.

> It's been announced that His Majesty the King of Thailand has taken
> the amateur radio callsign HS1A.

I wonder if he took an exam? :-)

I sometimes wonder about the notable personages that pop up now and then in the ham community... Many of them, of course, became hams before they became notables, and learned the code and took the tests as ordinary mortals. But a King, now, being the head of a government, can issue Himself a license and get on the air as He feels like...

(No aspersions cast on the example cited -- I'll assume he studied theory and code and went thru the normal process. Wouldn't you have hated to be the Thai equivalent-of-the-FCC guy that gave His Majesty the exam, though? :-) :-) :-)

[I do bet His Majesty didn't have to wait a long while for his license to come in the mail! :-)]

Regards, Will

This file is: INTRO MODS

MODS database
---- --------

This database was setup to archive files containing information on
how to modify radio equipement to either improve its performance,
or add new functions or capabilities to the radio.

To access a file from the archive, send a message to the server running
under userid -> BITLIB@UWO.CA
Also you may try the userid -> BITLIB@UWO.CDN

The subject of the message must be -> MODS

The text of your message descibes what files you want. For example:
sendme intro mods
sendme radio mods
sendme TH215 mods

You can have as many requests in the same message as required.
INTRO MODS is the file you are reading now.
RADIO MODS is a list of files available.
TH-215 MODS is a file that can be requested.

Below is an example of a file request message:

.................................................................
.
. Date: Friday, April 5, 1989
. From: MBRAMWEL@BUSINESS.UWO.CA (Mark Bramwell)
. Subject: MODS
. To: bitlib@uwo.ca
.
. from: mbramwel@uwo.ca
. sendme radio mods
. sendme pro2004 mods
. sendme tm721 mods
.
.................................................................

In the above example I have a 'from:' line in my message. That will
tell the server to send to an id other than the id listed in the
header. The userid should be reachable from bitnet. That means
UUCP users should include a gateway in their id.
```

To submit a file for the database, send me the message and I will
add your entry to the database.

**Note: If you don't seem to be getting a reply to your requests, it is
probally due to the fact that your header doesn't show a reachable
address. You must be reachable from UWO. You can place your return
address in the first line of your message. Example:
FROM: someuser@somenode

UUCP users have had some success by stating their address as:
userx!usery!userz@julian.uucp
Julian can usually find most gateways.

Any questions or concerns can be directed to:

Subject: TM-731A RPTR & OUT-OF-BAND MODS
Path: N8HTG!VE3WZL

Thanks to the efforts of our local technical wizard, Bob VE3GVD, we now have the secret to making the new Kenwood TM-731A do the same fancy tricks that its sister rig the TM-721A did. Here is how it's done:

1) Remove the top and bottom covers, and take out the screws that will allow the front panel assembly to swing down.

2) With the rigs front facing you and the top side up, locate R 121 and R 125 which are both immediately to the left of the lithium battery.

3) Using a low wattage iron and tweezers, remove R 121 which is about the seven o'clock position with respect to the battery and reinstall it in the blank position designated for R 125 which is about the eight-thirty position with respect to the battery.

4) Now locate R 57 on the back of the circuit board that is attached vertically to the main chassis. (It's the board behind the front panel when the panel is folded up) Carefully un-solder and lift off the grounded end.

That completes the mod. Having a service manual, or at least a board layout will assist you in locating the components. It will be neccessary to do a reset on the microprocessor as described in the user manual after doing the mods described.

For those curious as to what does what, removing R 121 enables the repeater cross-band function, and the adding of R 125/removal of R 57 enables the out-of-band features.

I used to have a TM-211A and now have a TM-221A. The "E" versions are the same radio (the faceplates get changed for the correct version), but just have diodes (or resistors) to set the type and associated features.

The optional Kenwood service manuals, I believe, contain the settings for about 3 or 4 diodes (TM-211) or surface mount resistors (TM-221). In fact, I believe the A or E settings are given on the schematic included with the radio. By playing around with these, you can open up the transmit range, change the receive coverage, and add and delete certain other features.

I'm sure the same is true for the 711.

2819. Hugo traffic nets, irresponsbility, and why no one cares (long)

Newsgroup: rec.ham-radio
Date: 1989-09-22 16:07:24 UTC
From: MEHARP01@ULKYVM.BITNET
Message-ID: <8909230709.AA06718@ucbvax.Berkeley.EDU>
Source record: 16756

I was listening to 14.325 and 3.915 last night as they worked Hugo emergency traffic nets. NJ7E and Co. did their usual stellar job handling a very difficult situation. I know NJ7E is a net person and I hope I am the first to offer him congratulations!

The situation on 80 meters was a little different. I heard and recorded what had to be the single most disgusting radio traffic I am ever likely to hear. I have callsigns and I am seriously considering writing the FCC and submitting my tape.

The emergency net on 3915 was trying to work life and death traffic from Charleston and other areas in the Carolinas. A "net" was in progress on 3913 that consisted of three or four overmodulated, overpowered stations ragchewing. This would normally not be a problem, but they were bleeding over to 3915 and making communications difficult. One station in the emergency net went down to 3913 to ask the net control to move his station. Then all Hell broke loose.

Not only did the guy on 3913 refuse to move, but he seemed to increase his power and began using abusive language. He assaulted the emergency net operator verbally, making accusations that what they were doing was illegal, etc., etc. It got worse, turned into a pileup of foul language interference, and generally horrible operating practice. I lost the net on 3915 right as the storm hit. I am assuming they were knocked off the air. I certainly hope they didn't close because of the 3913 mess.

This kind of behavior is exactly why no one cares about amateur radio. I am really glad my fiance' or other people I am trying to get interested in radio didn't hear that. It was disgusting, pathetic, and intolerable.

I would like to see the operators on that net cited, fined and suspended from the service. There is NO justification for that kind of behavior.

I invite comments.

'Tis true. Another use is for telemetry of meteorological data from
met. buoys which are released and allowed to follow the currents. A
master station sends a pilot carrier at a high TOA every so often, and
when the buoy hears it, it assumes that a temporary path exists & then
transmits its recorded data. Evidently a solved problem...

Does anyone know of RTTY weather broadcasts in the Midwest/Great
Lakes area? I know of some down in southern Texas, but I don't have
a HF receiver / RTTY unit right now, but if there is something that
broadcasts in this area I'd pick one up. If no one has specifics,
I'll order a book if someone has information.

Correct me if I'm mistaken, but we can still do the SSB phasing demodulation in software with the receiver as shown in the diagram (assuming blazingly fast processing hardware). The only function of the mixer is to shift the input signal frequency down to a more comfortable range for the A-D and DSP.

Of course, if you had REALLY fast hardware and software, you could dispense with the mixer and local oscillator altogether... I vaguely remember a conversation I had with the designer of some sort of (fairly low frequency?) (aeronautical navigation?) receiver, where they did essentially this in an ASIC. It doesn't seem entirely practical to me now, so I'm probably forgetting something critical. I'll post again if I can come up with the details.

They can also survive being dropped into a bucket of paint.

A friend collected several HT200's and other nice Motorola radios in
the bushes below a railroad trestle near Indianapolis. Railroad
unionists used to trash radios at every opportunity because they
feared that radios would eliminate jobs. Unfortunately, these radios
were in the 160-MHz railroad band and were very difficult to convert
to 2m.

Since Hurricane Hugo is now over, and since they are taking about 4 MB
of space, the hurricane GIF pictures will be deleted from SIMTEL20 in a
week or so. If you want any of them, be sure to get them while they're
still there.

To review, they are on PD3:<MISC.GIF> on WSMR-SIMTEL20.ARMY.MIL. They require
a GIF viewer that supports (at least) 16 shades of grey to be viewed properly;
a VGA seems to be necessary to view them on a PC.

I believe that in a TRUE emergency, (yes a judgement call - but I think a
life-and-death situation obviously counts), anyone is allowed to transmit
on any frequency if necessary.

This implies (to me) if you had a life-and-death emergency and couldn't raise
anyone on your local repeaters using your 2M HT, and no other means were
available, you could legally contact police (if the HT was modified to
transmit out-of-band) directly.

Any comments?

Unless a life is in immediate danger, I don't think we should be
messing around on non-ham frequencies, even for accidents. For
one thing, a lot of city police repeaters need a sub-tone to be
brought up and unless you know the tone and have ability to transmit
it you won't get in. Plus you are going to create a mess after everything
is done with police inquiries to your actions. If you do transmit off
of ham frequencies, make it as short as possible and to the point, do
not tie up the channel.

+
+ The ARRL has been trying to destroy amateur
+radio by forcing incentive licensing on us in the 60's and not promoting
+no-code licensing in the 70's. I know because I have been reading Wayne
+Green's columns for 20 years and that's what he says.

This is the side of the argument on which I find myself. The FCC had been in favor of a no-code license long ago..the Nerds-of-Newington would have nothing to do with it..ah well..times change..I think we may find that the new Communicator-class license will help us to grow our numbers enough to finally overwhelm the "Morse-Fundamentalists", don't get me wrong; CW has it's place. I even enjoy it ocassionally, but it's not a reasonable filter, most of the jerks that can be found QRMing phone patches on 20m are quite capable of doing 20WPM..they just don't understand the legal framework of Part 97, nor do they have a lick of common sense or courtesy. You won't find those jerks in the CW portions of the bands, they passed the tests (although most are quite rusty or have forgotten CW completly) and now spend their time "QRMing the LIDs" as they like say. Meanwhile, a quiet revolution is comming. The newer hams are more tech-savy, and are willing to readup and keep current on things..unlike the OF's..pretty soon they will be history. And the Morse code will be religated a place of honor, most likely a 20KHz slice at the bottom of each band; this to make way for more of the digital modes. For those people like myself, the Future looks bright..for those living in a "50's Fantasy"..of what Amateur Radio was in the "good-old-days"..the Future is unclear, and confusing.

+ QST was always too full of DX columns, contest
+stuff and pages and pages of district representatives to leave much room
+for technical stuff.

Amen. Some people like paper-chasing. It's not my cup-of-tea. I've worked everything my privs allow (up to 10GHz!) OSCAR, EME, the works! I doubt that having a skill like 13 WPM is gonna make me any better..I'll pass the test eventually, it just seems totally stupid and unnecessary. Most of the Extras I know are nice guys but don't know jive about AX25, etc..except for having parroted-back what was required for the written tests. I've already passed the Advanced Written (ele 4a)..I could most likely do 4b while in the shower...and stoned! ;-)

I'd be in favor of having QST eliminate the contest crap, and send that stuff out to interested parties via a seperate organ (like I get some of my tech articles from QEX!) and stop subjecting the rest of us to it.

+Really though, let's leave the poor ARRL alone these days. They're about
+broke anyway.

+
Broke? How's that???

I would suggest that this be under rec.ham-radio, and since dx'ing is
the common denominator (the local FM station is usually not of interest
to swls) a more appropriate name might be rec.ham-radio.dx-listening.

Also, before people get carried away, DON'T POST VOTES! First, that's
not how it's done, and second, it isn't time yet. (I've already seen
one, and that was too many.)

I hear BBC London in the 12MHz band, down here.

The full wording of PRB-1 appears at the back of the ARRL's publication, "The FCC Rule Book" 7th edition (the one with the bright purple cover).

I have typed it myself, which took a long time; however, it is my philosophy that this is what the net is for, and furthermore, with the hope that one of you might do the same for me, would I need it!

Have fun ... pls post a copy of the antenna situation here - not much raises more emotion than PRB-1-related antenna problems (don't you just HATE neighbors???? :-))

Here goes:

------------------------------ CUT HERE ------------------------------

MEMORANDUM OPINION AND ORDER IN PRB-1

Before the
Fderal Communications Commission FCC 85-506
Washington, DC 20554 36149

In the Matter Of)
)
Federal preemption of state and) PRB-1
local regulations pertaining)
to Amateur radio facilities.)

MEMORANDUM OPINION AND ORDER
Adopted: September 16, 1985 ; Released: September 19, 1985

By the Commission: Commissioner Rivera not participating.

Background.

1. On July 16, 1984, the American Radio Relay League, Inc. (ARRL) filed a request for issuance of a Declaratory Ruling asking us to delineate the limitations of local zoning and other local and state regulatory authority over Federally-licensed radio facilities. Specifically, the ARRL wanted an explicit statement that would preempt all local ordinances which provably preclude or significantly inhibit effective reliable amateur radio communications. The ARRL acknowledges that local authorities can regulate amateur installations to insure the safety and health of persons in the community, but believes that those regulations cannot be so restrictive that they preclude effective amateur communications.

2. Interested parties were advised that they could file comments in the matter. With extension, comments were do on or before December 26, 1984, with reply comments due on or before January 25, 1985. Ovewr sixteen

hundred comments were filed.

Local Ordinances.

3. Conflicts between amateur operators regarding radio antennas and local authorities regarding restrictive ordinances are common. The amateur operator is governed by the regulations contained in part 97 of our rules. Those rules do not limit the height of an amateur antenna but they require, for aviation safety reasons, that certain FAA notification and FCC approval procedures must be followed for antennas which exceed 200 feet in height above ground level or antennas which are to be erected near airports. Thus, under FCC rules some amateur antenna support structures require obstruction marking and lighting. On the other hand, local municipalities or governing bodies frequently enact regulations limiting antennas and their support structures in height and location, e.g. to side or rear yards, for health, safety, or aesthetic considerations. These limiting regulations can result in conflict because the effectiveness of the communications that emanate from an amateur radio station are directly dependent upon the location and the height of the antenna. Amateur operators maintain that they are precluded from operating in certain bands allocated for their use if the height of their antennas is limited by a local ordinance.

4. Examples of restrictive local ordinances were submitted by several amateur operators in this proceeding. Stanley J. Cichy, San Diego, California, noted that in San Diego amateur radio antennas come under a structures ruling which limites building heights to 30 feet. Thus, antennas are so limited to 30 feet. Alaxender Vrenios, Mundelein, Illinois wrote that an ordinance of the Village of Mundelein provides that an atnenna must be a distance from the property line that is equal to one and one-half times its height. In his case, he is limited to an antenna tower for his amateur station just over 53 feet in height.

5. John C. Chapman, an amateur living in Bloomington, Minnesota, commented that he was not able to obtain a building permit to install an amateur radio antenna exceeding 35 feet in height because the Bloomington city ordinance restricted "structures" heights to 35 feet. Mr. Chapman said that the ordinance, when written, undoubtedly applied to buildings but was now being applied to antennas in the absence of a specific ordinance regulating them. There were to options open to him if he wanted to engage in amateur communications. He could request a variance to the ordinance by way of a hearing before the Cty Council, or he could obtain affidavits from his neighbors swearing that they had no objection to the proposed antenna installation. He got the building permit after obtaining the cooperation of his neighbors. His concern, however, is that he had to get permission from several people before he could efectively engage in radio communications for which he had a valid FCC amateur license.

6. In addition to height restrictions, other limits are enacted by local jurisdictions - anti-climb devices on towers or fences around them; minimum distances from high voltage power lines; minimum distances of towers from property lines; and regulations pertaining to the structural soundness of the antenna installation. By and large, amateurs do not find these

safety precautions objectionable. What they do object to are the sometimes prohibitive, non-refundable application filing fees to obtain a permit to erect an antenna installation and those provisions in ordinances which regulate antennas for purely aesthetic reasons. The amateurs contend, almost universally, that "beauty is in the eye of the beholder." They assert that an antenna installation is not more aesthetically displeasing than other objects that people keep on their property, e.g. motor homes, trailers, pick-up trucks, solar collectors, and gardening equipment.

Restrictive Covenants.

7. Amateur operators also oppose restrictions on their amateur operations which are contained in the deeds for their homes or in their apartment leases. Since these restrictive covenants are contractual agreements between private parties, they are not generally a matter of concern to the Commission. However, since some amateurs who commented in this proceeding provided us with examples of restrictive covenants, they are included for information. Mr. Eugene O. Thomas of Hollister, California included in his comments an extract of the Declaration of Covenants and Restrictions for Ridgemark Estates, County of San Benito, Satte of California. It provides:

No antenna for transmission or reception of radio signals shall be erected outdoors for use by any dwelling unit except upon approval of the Directors. No radio or television signals or any other form of electromagnetic radiation shall be permitted to originate from any lot which may unreasonably interfere with the reception of television or radio signals upon any other lot.

Marshall Wilson, Jr. provided a copy of the restrictive covenant contained in the deeds for the Bell Martin Addition #2, Irvint, Texas. It is binding upon all of the owners or purchasers of the lots in the said addition, his or their heirs, executors, administrators or assigns. It reads:

No antenna or tower shall be erected upon any lot for the purpose of radio operations.

William J. Hamilton resides in an apartment building in Gladstone, Missouri. He cites a clause in his lease prohibiting the erection of antenna. He states that he has been forced to give up operating amateur radio equipment except a handheld 2 meter (144-148 Mhz) radio tranceiver. He maintains that he should not be penalized just because he lives in an apartment.

Other restrictive covenants are less global in scope than those cited above. For example, Robert Webb purchased a home in Houston, Texas. His deed restriction prohibited "transmitting or receiving antennas extended above the roof line."

8. Amateur operators genrally oppose restrictive covenants for several reasons. They maintain that such restrictions limit the places that they can reside if they want to pursue their hobby of amateur radio. Some state that they impinge on First Amendment rights of free speech. Others believe that a constitutional right is being abridged because, in their view, everyone has a right to access the airwaves regadless of where they live.

9. The contrary believe held by housing dubdivision communities and condominium or homeowners associations is that amateur radio installations constitute safety hazards, beause interference to other electronic equipment whch may be operated in the home (television, radio , stereos) or are eyesores that detract from the aesthetic and tasteful appearance of the housing development or apartment complex. To counteract these negative consequences, the subdivisions and associations include n their deeds, leases or by-laws, restrictions and limitations on the location and height of antennas or, in some cases, prohibit them altogether. The restrictive covenants are contained in the contractual agreement entered into at the time of the sale or lease of the property. Purchasers or lessees are free to choose whether or not they wish to reside where such restrictions on amateur antennas are in effect or settle elsewhere.

10. The Department of Defense (DOD) supported the ARRL and emphasized in its comments that continued success of existing national security and emergency preparedness telecommunications plans involving amateur stations would be severely diminished if state and local ordinances were allowed to prohibit the constructions and usage of effective amateur transmissions facilities. DOD utilizes volunteers in the Military Affiliate Radio Service (MARS), Civil Air Patrol (CAP) and the Radio Amateur Civil Emergency Service (RACES). It points out that these volunteer communicators are operating radio equipment installed in their homes that undue restrictions on antennas by local authorities adversely affected their efforts. DOD states that the responsiveness of these volunteer systems would be impaired if local ordinances interfere with the effectiveness of these important national telecommunication resources. DOD favors the issuance of a ruling that would set limits for local and state regulatory bodies when they are dealing with amateur stations.

11. Various chapters of the American Red Cross also came forward to support the ARRL's request for a preemptive ruling. The Red Cross works closely with amateur radio volunteers. It believes that without amateurs' dedicated support, disaster relief operations owuld significantly suffer and that its ability to serve disaster victims would be hampered. It feels that antenna height limitations that might be imposed by local bodies will negatively afect the service now rendered by the volunteers.

12. Cities and counties from various parts of the United States filed comments in support of the ARRL's request for a Federal preemption ruling. The comments from the Director of Civil Defense, Port Arthur, Texas and representative:

The Amateur Radio Service plays a vital
role with our Civil Defense program here
in Port Arthur and the design of these

antennas and towers lends greatly to
our ability to communicate during times
of disaster.

We do not believe there should be any
restrictions on the antennas and towers
except for reasonable safety precautions.
Tropical storms, hurricanes and tornadoes
are a way of life here on the Texas Gulf
Coast and good communications are abso-
lutely essential when preparing for a
hurricane and even more so during recovery
operations after the hurricane has past.

13. The Quarter Century Wireless Association took a strong stand in favor of the Isuance of a Declaratory Ruling. It believes that Federal preemption is necessary so that there will be uniformity for all Amateur Radio installations on private property throughout the United States.

14. In its comments, the ARRL argued that the Commission has the jurisdiction to preempt certain local land use regulations which frustrate or prohibit amateur radio communications. It said that the appropriate standard in preemption cases is not the extent of state and local interests in a given regulation, but rather the impact of that regulation on Federal goals. Its position is that Federal preemption is warranted whenever local governmental regulations relate adversely to the operational aspects a variety of land use devices to preclude the installation of effective amateur antennas, including height restrictions, conditional use of permits, building setbacks and dimensional limitations on antennas. It sees a declaratory ruling of Federal preemption as necessary to cause municipalities to accommodate amateur operator needs in land use planning efforts.

15. James C. O'Connell, an attorney who has represented several amateurs before local zoning authorities, said that requiring amateurs to seek variances or special use approval to erect reasonable antennas unduly restricts the operation of amateur stations. He suggested that the Commission preempt zoning ordinances which impose antenna height limits of less than 65 feet. He said that this height would represent a erasonable accommodation of the communications needs of most amateurs and the legitimate concerns of local zoning authorities.

Opposing comments.

16. The City of La Mesa, California has a zoning regulation which controls amateur antennas. Its comments reflected an attempt to reach a balanced view.

This regulation has neither the intent, nor the effect, of precluding or inhibiting effective reliable communications. Such antennas may be built as long as their construction does not unreasonably bvlock views or constitute eyesores. The reasonable assumption is that there are

always alternatives at a given site for different placement, and/or methods for aesthetic treatment. Thus both public objevtives of controlling land use for the public health, safety, and convenience, and providing an effective communications network, can be satisfied.

A blanket ruling to completely set aside local conrol, or a ruling which recognizes control only for the purpose of safety of antenna construction, would be contrary to legitimate local control.

17. Comments from th eCounty of San Diego state: While we are aware of the benefits provided by Amateur Operators, we oppose the issuance of a preemption ruling which would elevate 'antenna effectiveness' to a position above all other considerations. We must, however, argue that the local government must have the ability to place reasonable limitations upon the placement and configuration of amateur radio transmitting and receiving antennas. Such ability is necessary to assure that the local decision-makers have the authority to protect the public health, safety and welfare of all citizens.

In conclusion, I owuld like to emphasize an important difference between your regulatory powers and that of local governments. Your commission's approval of the preemptive requests would establish a "national policy." However, any regulation adopted by a local jurisdiction could be overturned by your Commission or a court if such regulation was determined to be unreasonble.

18. The City of Anderson, Indiana summarized some of the problems that face local communities:

I am sympathetic to the concerns of these antenna owners and I understand that to gain the maximum reception from their devices, optimal location is necessary. However, the preservation of residential zoning districts as "liveable" neighborhoods is jeopardized by placing these antennas in front yards of homes. Major problems of public safety have been encountered, particularly vision blockage for auto and pedestrian access. In addition, all communities are faced with various building lot sizes. Many building lots are so small that established setback requirements (in order to preserve adequate air and light) are volnerable to the unregulated placement of antennas. The exercise of preemptive authority by the FCC is granting this request would not be in the best interest of the general public.

19. The National Association of COunties (NACO), the American Planning Association (APA), and the National League of Cities (NCL) all opposed the issuance of an antenna preemption ruling. NACO emphasized that federal and state power must be viewed in harmony and warns that Federal intrusion into local converns of health, safety and welfare could weaken the traditional police power exercised by the state and unduly interference with the legitimate activities of the states. NOLC believed that both Federal and local interests can be accommodated without preempting local authority to regulate the installation of amateur radio antennas. The APA said that the FCC should continue to leave the issue of regulating amateur antennas

with the local government and with the state and Federal courts.

Discussion.

20. When considering preemption, we must begin with two constitutional provisions. The tenth amendment provides that any powers which the constitution either does not delegate to the United States or does not prohibit the states from exercising are reserved to the states. These are the police powers of the states. The Supremacy Clause, however, provides that the constitution and the laws of the United States shall supersede any state law to the contrary. Article III, section 2. Given these basic premises, state laws may be preempted in three ways: First, congress may expressly preempt the state law. See Jones v. Rath Packaging Co., 430 U.S. 519, 525 (1977). Or, Congress may indicate its intent to completely occupy a given field so that any state law encompassed within that field would implicitly be preempted. Such intent to preempt could be found in a congressional regulatory scheme that was so pervasive that it would be reasonable to assume that Congress did not intend to permit the states to supplement it. See Fidelity Federal Savings & Loan Ass'n v. de la Cuesta, 458 U.S. 141, 153 (1982). Finally, preemption may be warranted when state law conflicts with federal law. Such conflicts may occur when "compliance with both federal and state regulations in a physical impossibility," Florida Lime & Avocado Growers, Inc. v. Paul, 373 U.S. 132, 142, 143 (1963), or when state law "stands an obstacle to the accomplishment and execution of the full purposes and objectives of Congress," Hines v. Davidowitz, 312 U.S. 52, 67 (1941). Furthermore, federal regulations have the same preemptive effect as federal statues, Fidelity Federal Savings & Loan Association v. de la Cuesta, supra.

21. The situation before us requires us to determine the exten tto which state and local zoning regulations may conflict with federal policies concerning amateur radio operators.

22. Few matters coming before us present such a clear dichotomy of view point as does the instant issue. The citues, counties, local communities and housing associations see an obligation to all of their citizens and try to address their concerns. This is accomplished through regulations, ordinances or covenants oriented toward the health, safety and general welfare of those they regulate. At the opposite pole are the individual amateur operators and their support groups who are troubled by local regulations which may inhibit the use of amateur stations or, in some instanes, totally preclude amateur communications. Aligned with the operatories are such entities as the Department of Defense, the American Red Cross and local civil defense and emergency organizations hwo have found in Amateur Radio a pool of skilled radio operators and a readily available backup network. In this situation, we believe it is appropriate to strike a balance between the federal interest in promoting amateur operations and the legitimate interests of local governments in regulatin glocal zoning matters. The cornerstone on which we will predicate our decision is that a reasonable accommodation may be made between the two sides.

23. Preemption is primarily a function of the extent of the conflict between federal and state and local regulation. Thus, in consideration whether our regulations or policies can tolerate a state regulation, we may consider such factors as the severity of the conflict and the reasons underlying the state's regulations. In this regard, we have previously recognized the legitimate and important state interests reflected in local zoning regulations. For example, in Earth Satellite Communications, Inc. 95 FCC 2d 1223 (1983), we recognize that "...countervailing state interests inhere in the present situation...For example, we do not wish to preclude a state or locality from exercising jurisdiction over certain elements of an SMATV operation that properly may fall within its authority, such as zoning or public safety health, provided the regulation in question is not undertaken as a pretext for the actual purpose of frustrating achievement of the preeminent federal objective and so long as the non-federal regulation is applied in a nondiscriminatory manner."

24. Similarly, we recognize here that there are certain general state and local interests which may, in their even-handed application, legitimately affect amateur radio facilities. Nonetheless, there is also a strong federal interest in promoting amateur communications. Evidence of this interest may be found in the comprehensive set of rules that the Commission has adopted to egulate the amateur service. Those rules set forth procedures for the licensing of stations and operators, frequency allocations, technical standards which amateur radio equipment must meet and operating practices which amateur operators must follow. We recognize the amateur radio service as a voluntary, noncommercial communication service, particularly with respect to providing emergency communications. Moreover, the amateur radio service provides a reservoir of trained operators, technicians and electronic experts who can be called on in times of national or local emergencies. By its nature, the Amateur Radio Service also provides the opportunity for individual operators to further international goodwill. Upon weighing these interests, we believe a limited preemption policy is warranted. State and local regulations that operate to preclude amateur communications in their communities are in direct conflict with federal objectives and must be preempted.

25. Because amateur station communications are only as effective as the antennas employed, antenna height restrictions directly affect the effectiveness of amateur communications. Some amateur antenna configurations require more substantial installations than others if they are to provide the amateur operator with the communications that he/she desires to engage in. For example, an antenna array for international communications will differ from an antenna used to contact other amateur operators at shorter distances. We will not, hwoever, specify any particular height limitation below which a local government may not regulate, nor will we suggest the precise language that must be contained in local ordinances, such as mechanisms for special exceptions, variances, or conditional use permits. Nevertheless, local regulations which involve placement, screening, or height of antennas based on health, safety, or aesthetic considerations must be crafted to accommodate reasonabl amateur communications, and to represent the minimum practicable regulation to accomplish the local authority's legitimate purpose.

26. Obviously, we do not have the staff or financial resources to review all state and local lawsthat affect amateur operations. We are confident, hoewver, that state and local governments will endeavor to legislate in a manner that affords appropriate recognition to the important federal interest at stake here and thereby avoid unnecessary conflicts with federal policy, as well as time-consuming and expensive litigation in this area. Amateur operators who believe that local or state governments have been overreaching and thereby have precluded accomplishment of their legitimate communications goals may, in addition, use this document to bring our policies to the attention of local tribunals and forums.

27. Accordingly, the Request for Declatory Ruling filed July 16, 1984 by the American Radio Relay League, Inc. IS GRANTED to the extend indicated and in all other respects is denied.

I'd go for rec.radio.monitoring. rec.monitoring is too vague.

rec.radio.monitoring is also very different than rec.radio.listening, which
is a kind of generality I'm specifically trying to avoid (we don't want to
have the group turn into "All FM radio is slime" type wars...).

2834. More on Meteors (80 lines long)

Newsgroup: rec.ham-radio
Date: 1989-09-23 04:41:49 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <8909230441.AA06174@cmr.ncsl.nist.gov>
Source record: 16757

I feel called upon to expamd on KD5RO's (and others') comments about the furation of meteor bursts, expecially un the 30-50 MHz region.

Despite what has been said, most bursts ARE only a few tens of milliseconds in duration at 40-50 MHz. HOWEVER....due to the inefficiencies of the channel protocols *** most data seems to be transfered on the very long, over-dense bursts. *** At least it was on my systems.

Any non-automatic, human operator controlled system is surely limited to the overdense bursts, just because of the low peak data rates that humans can copy.

I seem to remember that, outside of the great meteor shower periods, the total duration of 50-100 ms bursts is roughly equal to the duration of 1-2 s bursts, accumulated over a day. The problem is that you may have to wait an awfully long time for the few big bursts. As mentioned by others, there is a large diurnal effect, evening being worse that mornings by as much as a decimal order of magnitude, though perhaps not that much for the BIG meteors - but at one-every-few-hours at ham powers, the statistics don't come rapidly. Just think of meteor-burst communication at the modern equivalent of the old telegraph "night letter" (a concept coined by ex-W3KQS).

The "demo" system I built used this protocol (remember that it was built at about the time the first commercial computers were starting to work, so not even core memory was really easily available). Gross system numbers:-
41-42 MHz Freq sep 500 kHz Xmtr output 2 kW 5 el beams
Bit durations 250 us to 2 ms (10 to 80 times 60 wpm Baudot teletype)
1. Between bursts - both transmitters idle on tty SPACE frequency.
2. Other station heard - move to tty MARK frequency.
3. If you are both sending and receiving mark, start sending info.
4. If the signal gets too weak (or if you detect multipath problems) stop sending info and switch to SPACE. Enter 1-2 s holdout and then go to (1) or (2) as appropriate.
5. If you hear continuous SPACE, stop sending info and go back to (1) or (2).

The multipath problems occur on long overdense bursts where the high altitude winds distort the trail so that two widely-separated reflection areas occur - thus also the holdout to wait until the offending overdense burst dissipates.

Note that, since no data-processing equipment existed, data was send in units of 1 to 4 tty characters, with no headers, etc. The longer blocks were required at high speedups, since the tape recorders couldn't start and stop fast enough and longer interrecord gaps had to be used. The IBM 650 came out at about the end of the project, though I'm not sure that a drum machine like it would have been fast enough to be any help.... If we had only had

a 6502 or Z-80 !!

The key to using the shorter bursts is VERY low startup and header overhead.

On my ham contacts, we just used standard TNCs, with unlimited retries at very frequent intervals. This is a terrible choice for a number of reasons:- You can't catch the meteor if neither station's xmtr is on the air. The AFSK-FM mode is a VERY poor weak-signal choice. But it was quick and dirty.

COMMENTS:
> 1. Only ONE station's transmitter needs to be on the air continuously to probe for a meteor. This station really should be able to work full-duplex so that it can hear the replying station. You'll catch less than half the short bursts (at their beginnings), if the probing xmtr is off half the time.
> 2. R-T switching, startup delay, and other protocol overhead must be very fast if you want to use the short under-dense pings. This is very important on TWO, but that band is really too high for substantial data transfer by meteors - but they're nice for DXing.
> 3. The data has to be broken into short blocks in order to avoid resending long blocks. Remember that data may be lost at the end of each trasnmission and have to be resent, thus the acknowledgement must be for blocks that are much shorter than the average burst duration, if you want high throughput (unimportant if all you want to do is to work DX). The probing station could send acks as its probe, so the polled station would know the last block correctly transfered without handshaking. That could reduce the startup delay by at least one path round-trip - 6 ms at 1000 km.
> 4. For some heavily one-sided data com uses, only the destination station need be able to work full-duplex for good efficiency. Remember that full-duplex with tight frequency separations is HARD - and the two-way correlation decreases with frequency separation - I don't offhand know the numbers, though.

Enough already...

Bob, W3OTC

Part 1 of 2.

RTTY NOTES FOR WEEKENDING 22ND SEPTEMBER 1989 (BID RTDX2209)

IT SEEMS THAT THE PACKET RADIO/FREQUENCY DISCUSSION HAS TURNED INTO A
LARGER THAN LIFE EXPLOSION. SOME GROUPS WANTING MORE AND GIVING LESS,
WHILE OTHERS WANT THEIR OWN PRIVATE FREQUENCIES. THERE ARE OF COURSE THE
NORMAL PEOPLE WHO SAY, LETS ALL LIVE HAPPILY TOGETHER. AT THAT POINT I
THINK THAT I WILL LEAVE IT UNTIL THE DUST HAS SETTLED. THE GENERAL
CONSENSUS OF OPINION WOULD APPEAR TO BE, WE WILL NOT AGREE UNLESS WE GET
THE MOST OF EVERYTHING.

THE BANDS THIS WEEK HAVE BEEN VERY ACTIVE WITH SOME GOOD DX AROUND, AND AS
THIS WEEKEND IS THE RTTY CONTEST, WE HOPE FOR A LOT OF REAL RARE ONES TO
APPEAR OVER THE HORIZON. GOOD LUCK TO YOU ALL.

OUR THANKS THIS WEEK GO TO VK2EG TG9VT, W6/G0AZT, OD5NG, I5FLN, G0ABI,
G3XTL AND W1DA. THANKS CHAPS FOR THE INFORMATION.

QSL INFORMATION.

P29KK HAS A QSL MANAGER OF VK4AH.
TK/OE3CHC AND TK/OE3GAS WILL QSL VIA THEIR HOME CALLS.
TJ1MW'S QSL ADDRESS IS AMERICAN EMBASSY YAOUNDE, WASHINGTON, DC 20521-2520.
P43SF WILL QSL VIA HIS CALLBOOK ADDRESS.
ZS5VF WILL QSL VIA BOX 2664 DURBAN, S. AFRICA. 4000.
FM5CD QSL MANAGER IS F5VU.
JY9IU ASKS FOR HIS CARDS TO GO VIA HIS MANAGER HB9AHA.

NOTES OF INTEREST.

DJ6QT, WALTER, WILL OPERATE THIS WEEKEND AS T77C ON ALL BANDS.

OE3CHC AND OE3GAS WILL OPERATE FROM TK UNTIL 30TH SEPTEMBER.

SO4HBN IS A SPECIAL POLISH PREFIX, AND NOT, SORRY TO SAY, WESTERN SAHARA AS SOME THOUGHT.

TT8CW IS ATTEMPTING TO OPERATE WITH COMMERCIAL GEAR. NO LUCK AS YET, BUT IF IT DOES WORK YOU CAN QSL VIA F3CW.

ZS8MI IS STILL MISSING FROM THE RTTY BANDS. MAYBE HE WILL APPEAR ON 14090 KHZ ONE DAY.

IF YOU HAVE PROBLEMS WITH THE QSL FOR 3DA0AL, HE HAS NOT BEEN RECEIVING CARDS AT HIS CALLBOOK ADDRESS. SO WHEN IN DOUBT SEND THE CARDS TO 3DA0AH WHO WILL TAKE THE CARDS TO HIM.
KB2VO STATES THAT CARDS FOR HIS HD8S OPERAITION WILL BE AVAILABLE FROM HIS HOME ADDRESS.

VU2RUM WILL OPERATE AS AT0J AS WILL VU2JX DURING THE RTTY CONTEST THIS WEEKEND.
5B4BH HAS FIXED HIS MONITOR AND HAS BEEN OPERATING ON RTTY. ROD STATES THAT HE HOPES TO TAKE THE GEAR TO T5CT, BUT HE IS NOT SURE OF PERMISSION AS YET. BUT LIVES IN HOPE. HE HAS ALSO GOT 5H AND 5R ON HIS WORK SCHEDULE BEFORE THE END OF THE YEAR.

THERE IS ALSO A REPORT THAT THERE WILL BE OPERATION FROM H44 AND VK9L IN THE NEAR FUTURE.

JW3DLE/1 REPORTS THAT A JA AND SOME KH6 STATIONS HOPE TO GO TO PALMYRA, KH5, IN MARCH 1990.

GL DE DX1.

> capabilities by restricting antennas.

I think it's time for all good hams to throw a public-awareness day
in the next couple of weeks. This will provide a positive forum to
give the general public of what hams radio do in the community.
This is a great opportunity for great PR, don't lose it!

(And this is comming from a non-Ham operator! ;)

Subject: Analog Audio Delay?

I need an audio delay on the order of 1ms to 10ms for a full-break-in
voice system I'm developing. Any idea where I can get such a beast?
An analog "bucket brigade" device seems like it would be just right

but I haven't been able to find any. DigiKey has them in their
catalog but they don't really have them. I was told that it would
take 18 weeks to get one. Going digital is really more complicated
that I'd like. Any other simple ways to get delays in milliseconds?

Gary Bishop - WA4FUT

Date: Fri, 22 Sep 1989 10:26 EDT
From: Business School Server <watmath!julian!business.uwo.ca!bitlib@uunet.UU.NET>
Subject: File INTRO MODS

This file is: INTRO MODS

MODS database
---- --------

This database was setup to archive files containing information on
how to modify radio equipement to either improve its performance,
or add new functions or capabilities to the radio.

To access a file from the archive, send a message to the server running
under userid -> BITLIB@UWO.CA
Also you may try the userid -> BITLIB@UWO.CDN

The subject of the message must be -> MODS

The text of your message descibes what files you want. For example:
sendme intro mods
sendme radio mods
sendme TH215 mods

You can have as many requests in the same message as required.
INTRO MODS is the file you are reading now.
RADIO MODS is a list of files available.
TH-215 MODS is a file that can be requested.

Below is an example of a file request message:

```
.................................................................
.
. Date: Friday, April 5, 1989
. From: MBRAMWEL@BUSINESS.UWO.CA (Mark Bramwell)
. Subject: MODS
. To: bitlib@uwo.ca
.
. from: mbramwel@uwo.ca
. sendme radio mods
. sendme pro2004 mods
. sendme tm721 mods
.
.................................................................
```

In the above example I have a 'from:' line in my message. That will tell the server to send to an id other than the id listed in the header. The userid should be reachable from bitnet. That means UUCP users should include a gateway in their id.

To submit a file for the database, send me the message and I will add your entry to the database.

**Note: If you don't seem to be getting a reply to your requests, it is probally due to the fact that your header doesn't show a reachable address. You must be reachable from UWO. You can place your return address in the first line of your message. Example:
FROM: someuser@somenode

**** Rest omitted - too long!

2838. Re: rec.swl?

Source record: 16765

Well too bad the original poster has already given up. Two people on MY system tried to send him "go for it votes" but the mail bounced, so I am posting here.

I was disappointed to find that USENET does not have a separate SWL group. I am a very active ham, and a very active SWL, and a totally bonkers scanner buff. I would like to see groups for all these, PLUS satellite TV. HOWEVER if such posts are welcome here, as has been indicated, then lets start posting them H E R E !

You can effectively get an SWL group, by just searching for SWL in the subject. I suggest all SWL postings have SWL in the header. See if it flies. I bet if such postings DID begin to flood this group, we would be ASKED to start a separate group, and all those people who originally wrote saying that an SWL group is not needed would perhaps think again.

SO, Lets start RIGHT HERE!!!!!!!!!!!!!!

Anyone have the current sched for Nibi-Nibi?????

2839. Complete list of Hurricane Hugo pictures

Newsgroup: rec.ham-radio
Date: 1989-09-23 15:18:15 UTC
From: roskos@IDA.ORG
Message-ID: <1989Sep23.151815.27300@IDA.ORG>
Source record: 16762
Cross-posted to: sci.misc,sci.space,rec.ham-radio,comp.graphics

The following is the updated list of all the Hurricane Hugo GIF pictures. Most of these are temporarily available on WSMR-SIMTEL20.ARMY.MIL for a short time longer, but have to be deleted because they are taking over 4MB of disk space. They are in PD3:<MISC.GIF>. All times in the table below are EDT (E+1). I've tried to give a fairly critical description of the images so that if you are only interested in a few of the pictures that look good, you can tell which to skip and which to choose. But I've included all of them even if the signal was not too good, for the people interested in tracking the hurricane based on the satellite pictures, or similar observations.

-- Eric Roskos
roskos@IDA.ORG

(Please don't FTP to IDA.ORG trying to access these pictures. We don't have FTP service available here, so they aren't archived here.)

HUGO1.GIF 9/17 7:15AM GOES IR
Has some noise over the hurricane image due to HF propagation conditions. HF conditions are currently only moderately good here for receiving the GOES pictures, so this tends to be a problem in a number of them (conditions were much better for the Hurricane Gabrielle pictures).

HUGO2.GIF 9/17 8:20AM Meteor 3-2
This is a picture from the Soviet Meteor satellite, before I modified my receiver to have a wider bandwidth. You may want to skip this one unless you are really interested in having all of them.

HUGO3.GIF 9/17 11:00AM Meteor 2-16
This and subsequen Meteor pictures were recorded after I modified my receiver to have a 25 KHz bandwidth, so the picture quality is better. (I'm still looking for a way to get a wider bandwidth, though.)

HUGO4.GIF 9/17 1:47PM NOAA 11
An enlargement of the hurricane as it approaches Puerto Rico and the Dominican Republic; the latter is visible in the picture. At this time the satellite was passing over the hurricane as it came over the horizon at my location, so the image emerges out of the background noise as the signal is acquired.

HUGO5.GIF 9/17 1:47PM NOAA 11
An unzoomed image of the above; I was testing the new IF filter

in the radio at this time, so the quality of the picture varies.
You may want to skip this one too.

HUGO6.GIF 9/17 7:15PM GOES IR
This is a fairly good GOES Infrared picture of the hurricane
as it began to reach Puerto Rico.

HUGO7.GIF 9/17 7:15PM GOES IR
An enlargement of HUGO6.GIF.

HUGO8.GIF 9/18 8:00AM Meteor 3-2
Moderate picture of the hurricane from the Soviet satellite
Monday morning.

HUGO9.GIF 9/18 7:00PM GOES IR
Also moderate quality due to HF conditions. At this point the
hurricane had "wobbled around" Puerto Rico and is slightly to
the north of it.

HUGO10.GIF 9/18 7:00PM GOES IR
An enlargement of HUGO9.GIF.

HUGO11.GIF 9/19 7:00AM GOES IR
This picture is only of interest if you want to see the geographic
location of the hurricane, since the HF conditions were even worse
than usual. You probably should skip this one unless you want to
see the location of the hurricane as shown in HUGO13 and 14.

HUGO12.GIF 9/19 7:00AM GOES IR
Enlargement of HUGO11. See comments above.

HUGO13.GIF 9/19 7:40AM Meteor 3-2
The best picture thus far of the hurricane. It is illuminated
obliquely by the recently-risen sun to the East, so some shadow
detail is visible, including the small "eye" feature. Since
the hurricane had moved North some by this time, and since Meteor
3-2 gives a strong signal and is higher than the NOAA and Meteor 2
satellites, the quality of the signal was better than in previous
pictures. Note the length of the shadows to the left of some of
the isolated clouds to the left of the hurricane, and the sea-glint
from the sun reflecting off the ocean to the right.

HUGO14.GIF 9/19 7:40AM Meteor 3-2
An enlargement of HUGO13.GIF. If you only want to get one picture
from the Hugo images thus far, this is the best one. The very
delicate fringe of clouds to the South of the hurricane is clearly
visible, as well as the raised center and very small eye.

HUGO15.GIF 9/19 7:00PM GOES IR
HF propagation conditions were very good for most of this image
(they steadily improved throughout the image), but the subcarrier seemed
to be modulated by a fairly high-frequency (AF-range) signal at
the transmitter, with the result that the image is greyish and

mottled. It gives a good view of the position of the hurricane
a few hours ago this evening, as it heads towards the US, but
the quality is not very good due to the above problem.
Iris is also now clearly visible as distinct from Hugo (though
it is also visible in some of the earlier images), following
the path Hugo took a few days ago.

HUGO16.GIF 9/20 7:20AM Meteor 3-2
This is a very clear picture of the hurricane, although it is
partly off the left (West) edge of the image. Vertical doubling
of scan lines was used in this picture to make the aspect ratio
closer to square, since the Soviet satellites tend to stretch
the image horizontally. Most of the other Meteor pictures are
not displayed with doubling of scan lines, so you can see more
of the image on the screen, but it looks slightly "squashed"
along the vertical axis.

HUGO17.GIF 7/20 7:20AM Meteor 3-2
An enlargement of the original, un-doubled image used to produce
HUGO16.GIF. This is a very high-quality image of the hurricane.

HUGO18.GIF 9/20 8:30AM NOAA 10
Picture from the US TIROS-N NOAA 10 satellite, showing the entire
East coast of the US, with the hurricane off the coast of Florida.
This is an excellent-quality image.

HUGO19.GIF 9/20 8:30AM NOAA 10
Enlargement of the hurricane from HUGO18.GIF.

HUGO20.GIF 9/20 7:00PM GOES IR
Good infrared image, with the hurricane halfway between Puerto Rico
and the US. When looking at the GOES IR pictures, bear in mind that the
coldest (usually the highest) clouds appear whitest in the image.
You can also sometimes tell very general relative temperatures of
areas of sea and land, as well.

HUGO21.GIF 9/20 7:00PM GOES IR
Enlargement of HUGO20.GIF.

HUGO22.GIF 9/21 7:05AM Meteor 3-2
The hurricane is not visible in this picture; it is to the West of
the satellite, just out of range. The trail of clouds left behind
by the passing hurricane is visible, however.

HUGO23.GIF 9/21 8:05AM NOAA 10
The eye is clearly visible for the first time in this image. The
hurricane is beginning to approach the coast of the US.

HUGO24.GIF 9/21 8:05AM NOAA 10
An enlargement of HUGO23.GIF.

HUGO25.GIF 9/21 2:50PM NOAA 10
An early afternoon image of the hurricane; the sun is directly overhead,

so not much shadow detail is visible. There are also some noise bars over the hurricane image because of the satellite passing between the antenna and the roof of a building, so this picture is of limited quality. However, it is possible to see that the rain bands of the hurricane have reached land at this time.

HUGO26.GIF 9/21 2:50PM NOAA 10
Enlargement of HUGO25.GIF.

HUGO27.GIF 9/21 7:01PM GOES IR
Excellent infrared image; the hurricane is off the coast of South Carolina, approaching land. The outer edges of the hurricane have crossed inland and are causing rain throughout the coastal areas.

HUGO28.GIF 9/21 7:01PM GOES IR
Enlargement of HUGO27.GIF.

HUGO29.GIF 9/22 1:01AM GOES IR
About an hour after the hurricane reached Charleston, SC. The eye of the hurricane is visible, having already moved a good distance inland. The picture has noise in it due to the limited propagation conditions at this time of night, but the picture is of historical interest. The roof of the National Weather Service headquarters in Charleston was blown off by the portion of the hurricane that is over Charleston in this image.

HUGO30.GIF 9/22 1:01AM GOES IR
Enlargement of HUGO29.GIF.

HUGO31.GIF 9/22 2:43PM NOAA 11
Remnants of Tropical Storm Hugo are now far inland; the sky had begun to clear at the antenna site, in fact, by this time. (Note that this file is chronologically out of sequence; it should go where the missing HUGO34.GIF file is, after the 9/22 8:40AM images.)

HUGO32.GIF 9/22 8:40AM Meteor 3-2
An excellent picture of the hurricane inland over Hickory, NC the morning (about 8 hours) after it reached land. The storm is still fairly dense and well-organized, with a recognizable center. Wind speeds were reported at around 75 mi/hr at this time in Hickory.

HUGO33.GIF 9/22 8:40AM Meteor 3-2
Same image as HUGO32.GIF, but shifted further Northward to show structure of clouds in front of advancing hurricane.

HUGO34.GIF (No file with this name exists.)

HUGO35.GIF 9/23 8:30AM Meteor 3-2
About 32 hours after the hurricane reached land, some remnants of it are still visible far to the North, over the northeastern United States and Newfoundland. The principal weather feature visible in this picture, however, is the very highly visible cold front moving

to the Southeast over the Appalachian mountains. Compare this
picture with HUGO36.GIF to identify the location of various objects
in the picture; HUGO36.GIF was received from the US NOAA 10 satellite,
which resolves the boundary between land and water better, so it is
possible to see the continent outline and the great lakes better in
that image, although the Soviet Meteor 3-2 gives a larger and
higher-contrast image, so some better cloud detail is visible in
HUGO35.GIF.

HUGO36.GIF 9/23 9:00AM NOAA 10
This picture was recorded about 1/2 hour after HUGO35.GIF, from the
US NOAA-10 (TIROS-N) spacecraft. The entire East Coast of the US
is clearly visible. This image is centered somewhat to the South
of HUGO35.GIF, since Meteor 3-2 is higher and seems to have a stronger
transmitter, and thus continued to be received until it reached the
coast of Greenland. The Channel 3 Infrared image from NOAA 10 is
in the right half of the picture.

2840. Re: Hugo traffic nets, irresponsbility, and why no one cares (long)

Newsgroup: rec.ham-radio
Date: 1989-09-23 15:30:14 UTC
From: john@anasaz.UUCP
Message-ID: <740@anasaz.UUCP>
Source record: 16770

In article <8909230709.AA06718@ucbvax.Berkeley.EDU> MEHARP01@ULKYVM.BITNET (Michael Harpe) writes:
]
]I was listening to 14.325 and 3.915 last night as they worked Hugo
]emergency traffic nets. NJ7E and Co. did their usual stellar job
]handling a very difficult situation. I know NJ7E is a net person and I
]hope I am the first to offer him congratulations!
Thanks!
]
]The emergency net on 3915 was trying to work life and death traffic from
]Charleston and other areas in the Carolinas. A "net" was in progress on
]3913 that consisted of three or four overmodulated, overpowered stations
]ragchewing. This would normally not be a problem, but they were
]bleeding over to 3915 and making communications difficult. One station
]in the emergency net went down to 3913 to ask the net control to move
]his station. Then all Hell broke loose.
]
]Not only did the guy on 3913 refuse to move, but he seemed to increase
]his power and began using abusive language. He assaulted the emergency
]net operator verbally, making accusations that what they were doing was
]illegal, etc., etc. It got worse, turned into a pileup of foul language
]interference, and generally horrible operating practice. I lost the net
]on 3915 right as the storm hit. I am assuming they were knocked off the
]air. I certainly hope they didn't close because of the 3913 mess.

As a net controller on the Hurricane Watch Net, I am appalled at the
behavior of a few hams. There are three sorts who give us trouble:
(1) Intentional jammers - more on that later.
(2) "helpers" - these are people who jump in and try to help by
telling the jammers to go away or repeating what some other station
has said. These folks need to be aware that we have recognized
relay stations that will do what is required. Typically they
cost us more time than the jammers do in the first place!
(3) The idiots! These are the folks who either don't listen long enough
to recognize the net rules, ignore the net rules, or simply don't
know the rules. These are the ones that pop up, when a call is
put out for emergency traffic only, and turn out to be in Ohio
and want to find the latest hurricane report from Puerto Rico,
or want to run Health and Welfare traffic.

I should point out, though, that there must be tens to hundreds of
thousands of hams listening to these nets during the emergencies
that are to be commended for having the good sense to only transmit
when appropriate. These folks are doing it right!

By the way, as the only ham in Phoenix active in hurricane related activities, I often have TV reporters in my shack (they call me - I don't call them!). I am often embarrassed by what they hear over the radio (and sometimes what gets passed on to their listeners during live broadcasts)!

As far as the intentional jammers go, I think that these people need to spend a fair amount of time contemplating their activities in a federal penitentiary! Unfortunately, we almost never catch them, and when we do they only get their wrists slapped. The FCC has way too few resources to devote to enforcing amateur rules, so we hams really need to form a national HF/DF organization that can call on local interference committees to track these folks down in real time and get them shut down. Here in Phoenix, if we found someone jamming an HF emergency net, we would have him in jail in about 30 minutes - due to an agreement with the local federal attorney. I suspect that most of these folks are long time offenders, and if we had adequate enforcement they would have been removed from the bands BEFORE they QRM vital traffic.

I would try to get the national network going but really don't have the time. The ARRL doesn't (IMHO) give this enough priority. It is a natural outgrowth of the Volmon program, but neither the FCC nor the ARRL provide any real national coordination for these programs other than accreditation.

NOTE: I speak only for myself and not for The Hurricane Watch Net, Inc, the ARRL (for which I'm the AZ OOC) or my employer.

2841. Sony 2010 Antenna WARNING

Newsgroup: rec.ham-radio
Date: 1989-09-23 15:40:22 UTC
From: flash@lopez.UUCP
Message-ID: <809@lopez.UUCP>
Source record: 16766

This is a CAVEAT to anyone contemplating connecting their SONY ICF-2010 to an outside antenna. In addition to overloading on strong signals, you risk damaging the receiver.

I know of FOUR people this happened to (including myself). Sony is aware of the problem, as is much of the SWL community.

What happens is that a static charge can totally WIPE OUT the RF PREAMP TRANSISTOR. This destroys the sensitivity of the set, and also increases distortion on some signals.

It might not be obvious at first that this has happened, since even with the transistor blown, the radio continues to receive strong stations fairly well.

If you think your 2010 might be damaged in this manner, disconnect it from the long antenna (80 meter dipoles seem to destroy the radio best), and see what you can hear with the whip. Also tune your local broadcast band, and see how stations from nearby cities come in (pick a low power station) If it does not come in as well as when you first got the radio, then you have fried the preamp.

This transistor is fairly easy to replace, and is obtainable from sony, but of course you need the shop manual for the radio. Taking it apart is a bit tricky, and getting it back together takes more time than the repair does.

If under warranty, Sony will fix or repair the radio at their option. Mine was replaced, while a friend had his repaired. As a bonus he also got his realigned.

I saw some disagreement here whether the SYNCH detector is worth the money and the HYPE. I think it is. I made an audio tape showing the difference with synch on and off when I got my set. The difference is that you no longer miss words that are distorted during selective fading. Yes there is still a bit of a pitch change, and you still hear some effects of the fading, but your brain does not have to fill in the gaps from distorted words any more.

FOR PROOF that the synch detector works, do this. FIND a VOA SSB feeder. These are SSB with reduced carrier, enough carrier for the 2010 to lock. Here you can really hear the dramatic effect of synch on and synch off, because the distorted sideband signal is exactly the same thing that happens during a selective fade, except it is prolonged so you can really hear what the circuit does. In fact, if the VOA feed has two programs running (as many of them do) you can SELECT WHICH PROGRAM YOU WANT with the tuning control. Lock on the UPPER synch light and hear one program, and

tune down in frequency 100 hz and hear a totally different program. The audio on these VOA feeds is superb on the 2010, you would never believe you are listening to a sideband transmission.

Just remember if you connect the 2010 to a longwire outside antenna you are putting the set at risk. In practice I find a wire run around the room or a small wire outside is PLENTY. Stay away from 80 meter dipoles!

>
>No offence to Thais and all that, I still need to work HS :-)

Not only that, there are HS-people who are reading rec.ham-radio! :-) :-)

No offence taken, of course. Afterall, I would have to work a whole lot
of W's when I finally go for my ticket :-)

By the way, in case people get the wrong impression, HS-land is a
constitutional monarchy. The Thai king has no more power than Elisabeth
II. As to whether he passed his tests, one can only guess. At least
his call has a suffix. Jordan has two hams with the call-letters JY1
and JY2. Yep, those are not prefixes, they are calls! Guess who owns
them :-). No offense to King Hussein, I may need JY for DXCC :-).

The *real* question is, can HS1A phone-patch to order pizza !?! :-)

OSCAR-9 Telemetry as of 01:57:19 UTC on 23Sep89:

UOSAT-1 8909230015719 COMPUTER GENERATED TELEMETRY

[Inline base64-encoded payload not displayed]

Note that no error checking was performed on the raw telemetry frame.
When the preceeding information was received at KD2BD, OSCAR-9 was NOT transmitting any news bulletin or whole orbit data (WOD).

OSCAR-9 was in darkness when this telemetry frame was generated.
Here are some spacecraft temperatures decoded from the telemetry frame above:

[09] +X Facet Temperature : -27.7 C
[19] -X Facet Temperature : -28.7 C
[39] +Y Facet Temperature : -35.4 C
[29] -Y Facet Temperature : -19.8 C
[49] +Z Facet Temperature : -14.3 C
[59] -Z Facet Temperature : - 9.1 C
[57] CCD Imager Temperature : - 3.4 C
[08] Battery Pack A Temperature : - 2.4 C
[18] Battery Pack B Temperature : - 8.3 C

OSCAR-9 is expected to burn up in the earth's atmosphere within the next two weeks.

* MICROSAT NEWS *

All four MicroSats (PACSAT, LUSAT, DOVE and WEBERSAT) are expected to be transported to French Guiana today, where they are scheduled to be launched on 10Nov89.

Each of the four MicroSats recently completed their thermal vacuum and vibration testing at the Martin-Marietta facilities in Colorado. External antennas connected to the MicroSats enabled the AMSAT Test Team and other Amateurs in the Denver area to use the MicroSats as if they were in orbit.

After almost 48 hours of testing, all four satellites were found to be functioning perfectly.

* OSCAR-12 SCHEDULE *

DATE MODE TIME (UTC)

26Sep JA 15:12 - 23:24
30Sep JD 21:50 - 12:44 on 10/01
06Oct JD 20:29 - 11:23 on 10/07
10Oct JA 10:42 - 18:54

2845. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-09-23 19:52:55 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8909240709.AA12928@ucbvax.Berkeley.EDU>
Source record: 16771

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

> I'd expected to see a lot of discussion by now of the new Part 97
> recently published. But, I'm will to kick off the ball with what
> I thought was a couple of very interesting sections.

It was dabbled on a while back, but I don't recall it got very big.
Maybe that was good.

[part 97 excerpts deleted]

> Well, this confirms the previous opinions of most that, in a life or
> death situation, anything goes. But for the first time (to my knowledge)
> puts it in writing. But this even goes further, it applys to property
> and a "station in distress" (That might prove fun to define. I really
> am distressed when I don't get fed on time, so I'll call up Pizza Hut
> for an order to go.)

You could define it that way. It might even hold up in court if it ever
gets that far. Personally I'd like to see this level of flexibility.
However, the biggest source of trouble you are likely to run into is NOT
from the FCC, but from your fellow hams who still interpret the rules (and
they MIGHT be right) differently in such as way that ordering a pizza is
disallowed. It's too bad they have to try to apply THEIR interpretations
to YOU, and cause grief and harrassment in the process. I recall that only
lawyers are allowed to give legal advice, and that might be considered to be
business, which might be illegal over the air, but you might have to talk
to a lawyer about that.

The control operator of a repeater, however, is a different case since it is
HIS station being used, and HIS license on the line, so HIS interpretations
have to apply there.

> I guess now we have a legitimate use for those mods to covert VHF/UHF

> traffic?"

Hmmm. I hope this is not done in excess. One definite danger exists in having the capability to do this. That is, if your radio is stolen, AND you have the receive and TRANSMIT capability programmed in already, then you have just allowed a thief the capability to interfere with public service radio communications. I'm not saying you should not do this, but rather, please consider all the possibilities before you decide what you do.

> I don't know about you, but I've come very close to doing something like

I would definitely be interested in the conversations that take place afterwards. If someone chooses to do this in an emergency situation as they interpret it, I'd sure like to hear how it went.

2847. Transmitting on police frequencies

Newsgroup: rec.ham-radio
Date: 1989-09-23 22:47:18 UTC
From: cep4478@ultb.UUCP
Message-ID: <1279@ultb.UUCP>
Source record: 16772

I am sure that many hams have thought that, in a life and death
situation (or something of comparable importance - if there is
such a thing) they would make use of their Out-of-band
modifications and contact law enforcement or emergency services
directly. I have never heard of a ham actually doing this, though,
except for those who are both ES workers and hams.

I have not made such modifications to my radio, mainly because it
is still under warranty. I can see a legitimate reason for saying
that we _should_ be able to transmit on police/EMS frequencies
if there were a legitimate emergency.

The problem, as I see it, is this: there are very few hams on the
air at 3:30 or 4:00am. If you were to come upon an accident on
the road, for instance, and couldn't bring somebody up, what would
you do? It would help if there were some standardization to emergency
autopatches, so that I would *know* that I could hit "911" on my
TTP and on at least one reachable repeater I would get 911.

Some clubs have even discontinued automatic 911 patchthru, because
of the "children" (regardless of age) who were playing around.

Combine this with my general paranoia about the PD's understanding
of radio in general.... I don't have a solution, but I do wonder
exactly what would happen when the officer I called on 155.550
arrived and saw me the only one with a radio. (I have even been
stopped by local police for carrying around my HT - "You're not
supposed to be walking around with a scanner!" - for this reason
I carry a copy of the NYS Vehicle & Traffic code pertaining to
police-radio receiving devices with me, as well as the waiver of
this law to licensed radio amateurs).

Comments?

[These are my own comments and have nothing to do with my university
or university amateur radio club]

Part 97 of the Commission's Rules) RM-___________
to establish code free license)
classes in the Amateur Service)
)
To: The Commission)

PETITION TO ESTABLISH CODE FREE LICENSE
CLASSES IN THE AMATEUR SERVICE

Introduction

1. My name is Philip David Howard. I am a licensed Technician class Amateur Radio operator. My Amateur Station call sign is KA9WGN. I have been licensed since November 1986. My address is found at the end of this petition.

Summary

2. This Petition for Rulemaking asks the Commission to consider changing Part 97 of its rules for the Amateur Radio Service to modify an existing license class and to create a new license class which will not require the passage of a Morse Code Telegraphy examination element by its new licensees. I believe this change will partially address needs in the Amateur Radio Service to further enhance its ability to perform the goals specified in 47 CFR 97.1 (Basis and purpose) by allowing participation in the service by new skilled and competent operators who do not possess, and do not seek, skills in the manual operation of Morse Code Radio Telegraphy. I further believe that increased public benefit will be realized by these changes, both by the activities of new operators in various areas of public service, as well as incidental benefits in areas of technical, scientific, and engineering education by a renewed technical emphasis integral to the proposed changes.

Proposed Changes

3. Suggested rule text for the changes proposed in summary form herein are contained in Appendix A.

4. A new license class shall be created as follows. The name of the new license class will be BASIC. The examination element for this license class will be a written element covering radio theory and radio regulations at a level that is presently required for the Technician license except that the number of questions will be increased from 25 to 40. This element should consist of the applicable portions of the present Novice written element plus the entire present Technician written element. There will be no Morse code telegraphy examination element. Examinations should be administered under the present Volunteer Examiner program.

5. The privileges for the new BASIC license class shall be as follows. All Amateur frequencies above 50 Mhz will be authorized. Peak transmitter output power will be limited to 50 watts on VHF and UHF bands and 5 watts on SHF bands and above. Any emission modes allowed on the operating frequency may be used. A Basic license class holder may transmit signals to the input of a repeater, including packet radio digipeaters, with the intent of using its retransmission facilities. However, a Basic license class holder shall not be the control operator of any repeater, digipeater, beacon, or auxiliary station in automatic or remote control mode. Call signs will be issued from block D.

6. The TECHNICIAN license class shall be modified as follows. The examination elements for this license class will be replaced by a written examination element covering an advanced level of radio theory and radio regulations as they apply to Amateur privileges above 50 Mhz. The number of question on this examination element will be 40. There will no longer be a Morse Code Telegraphy examination element for this license class.

7. The privileges for the modified TECHNICIAN license class shall be as follows. All Amateur privileges above 50 Mhz will be authorized. The privileges below 50 Mhz will be deleted. Repeater, beacon, and auxiliary operation on appropriate frequencies will be authorized. The effect of these authorizations is to delete all privileges below 50 Mhz.
8. The concurrent privileges of two license classes together under a single licensed issued by the Commission will be authorized. This DUAL-CLASS license will grant to the holder, the combined privileges of both licenses classes. This dual-class license is limited in the scope of this proposal to the combinations of Novice plus Basic and Novice plus Technician. All examination elements of both license classes to be held together must be passed.

9. Currently licensed holders of the Technician class license shall be grandfathered to holding the Dual Novice+Technician license classes together under a single license. Persons renewing an expired Technician license shall also be grandfathered provided they would otherwise have been eligible to renew their license under the current rules. By this arrangement, no privileges will be lost by presently licensed Radio Amateurs.

Supporting Arguments

10. The creation of a new radio service to accommodate the new areas of interest by many people was considered. However, many disadvantages exist in doing this. Such a new service would necessarily take away frequencies from the present Amateur Service because the new service would be similar the Amateur Service for which international allocations are made. Sharing

frequencies is unlikely to work. The new service would also cause a tremendous new burden on the Commission's operations due to new procedures and redundant licensing of operators into both services. By accommodating the interests in areas not requiring a Morse Code skill within the Amateur service, both groups can share experiences rather than be isolated.

11. Morse Code Telegraphy operating skill is not necessary for many types of radio operation now becoming commonplace in Amateur Radio. Amateur Radio is also a very diverse field encompassing many different areas of interest. This number is now so large that many people will only be interested in some of the areas rather than all of them. While there once was a time that Morse Code Telegraphy dominated Amateur Radio operations, it is today just one of the many diverse areas of interest. Many people can be Amateur Radio operators without ever using or needing Morse Code. Taking the time to study a skill that will be unused and unneeded by many just takes away from the time which can be better spent learning things directly applicable to the common portions of each area. This study should be radio theory in general, radio operation procedures, and radio regulations. The thorough study of a specific area should not be a part of the requirements for an Amateur Radio license.

12. Technology is progressing forward in faster and faster steps, but the technical education of people graduating from our schools is not keeping up. This is especially critical when compared to other nations such as Japan which place a strong emphasis on technical education. A technical emphasis in Amateur Radio is certainly not going to solve this problem. However, it can be of some help by encouraging many people to become more technically aware.

13. Two levels of a code free license are proposed so that one group of people can obtain a basic code free Amateur license without the burden of studying for advanced areas of VHF/UHF operation that fewer Amateurs are interested in. Yet, these advanced areas should be tested on to be sure that the licensee is prepared to operate in these areas which can impact Amateur and other radio operations. Of particular importance is the health, safety, and interference aspects of high power operation.

14. An upper level code free license class (Technician) is included in the code free track because of the lack of a particular need to possess a skill in manualMorse Code Telegraphy for the additional privileges in this class. The Technician class license, in the form in this proposal, has additional privileges beyond those of the Basic class license. These additional privileges, such as the authority to be the control operator of an amateur station in repeater operation, no more requires a skill in Morse Code telegraphy reception than do the privileges being granted the Basic class. Therefore, no Morse Code examination element should be required to increase the level of privilege along this track.

15. An entry level code free license class is not proposed because the purpose of the code free track is not to provide a learning medium for Morse Code as the Novice class does. The learning of Morse Code will be greatly enhanced by actual on-air practice under Novice privileges because of the practical nature of the skill. Radio theory and radio regulation study does not require actual on-air operation to be completed. Therefore a Novice class license is useful

in the process of learning Morse Code Telegraphy, but an entry level license in a code free track would not be of benefit.

16. Grandfathering existing licensees so that no privileges are lost is essential for the acceptance of the proposed rule changes by the present Amateur Radio community. Amateurs who would lose privileges under a different scheme without full grandfathering would be arbitrarily opposed to such a proposal.

17. The Dual-Class license concept provides for the flexibility to allow someone to concurrently pursue both tracks while also allowing distinct license class areas for those with more narrow interests. Dual-Class also provides the necessary flexibility to grandfather existing Technician licensees, since their privileges cross over the two major areas of interest, without needing another license class for this combination.

18. HF privileges are deleted from the modified Technician class to allow it to become the code free version of the full privileged VHF-and-above license class. International requirements still mandate a Morse Code examination for HF privileges. The Technician class at one time held only VHF-and-above privileges. Grandfathering and Dual-Class together prevent currently licensed Technicians from losing their present HF privileges.

19. Most operations by most Amateurs in the VHF and UHF bands is through FM repeaters for voice, and packet radio digipeaters for computer data. Significant range is still achieved even with the very low powers of a hand held portable radio when a repeater is involved. Power levels above 50 watts are simply not needed in all but the most extreme circumstances in activities expected of licensees of the Basic class. This fact is shown by the vast majority of mobile and portable radio transceivers having under 50 watts of output power, and many with much less. The Basic class is limited to 5 watts above 2450 Mhz primarily for health and safety reasons.

20. Although the 2 meter band in major metropolitan areas is full, access to 2 meters by new Amateur Radio operators holding VHF/UHF only privileges in areas distant from major cities is essential. Quite many areas of the country have so much less radio usage that high band VHF frequencies still dominate the Amateur Service as well as other services such as land mobile and public service.

Impact

21. The Dual-Class license concept will require a change to the license database to represent two license classes that will be held by some licensees. It could be possible to so with a minimum of impact by assigning special one letter codes for the class field that have the meaning of one of the two Dual-Class combinations that are possible. The current license form number 660 may continue to be used by abbreviating the word "Technician" when combined with "Novice" to allow both classes to appear in the proper block on the same form.

22. Two new examination elements will need to be prepared. Questions from the present Novice and Technician class written elements will be adequate for

the new Basic class. Questions selected from the Advanced and Extra class written elements should be adequate for the advanced level written examination element for the modified Technician class.

23. The expansion of the number of Radio Amateur operators as a result of these proposed changes, along with a renewed promotional effort made possible by these changes, is expected to increase the legitimate demand for equipment designed for the Amateur market. This will impact businesses operating in the Amateur market by increasing the sales of equipment.

Conclusion

24. The changes proposed in this Petition for Rulemaking are not expected to attract large numbers of new Amateurs on its own. However, these changes certainly can eliminate a barrier that has become more and more irrelevant due to the changing nature of Amateur Radio and radio technology. This will give Amateurs a new opportunity to actively promote the Amateur Radio Service to the public. Growth in Amateur Radio should come from this kind of renewed effort rather than a lowering of standards. I therefore respectfully request that serious consideration of these changes be made by The Commission.

Respectfully submitted,

By:_____

Philip D. Howard, KA9WGN
Amateur Operator, Technician class
1203 West Main Street, Apt. 3C
Urbana, IL 61801

Appendix A

This appendix is a set of specific rule changes suggested to serve as an example proposed by this petition.

1. Subpart A, Paragraph 97.9(a), is replaced as follows:

There are 6 classes of operator license privileges: Novice, Basic, Technician, General, Advanced and Amateur Extra. An operator license authorizes the holder to be the control operator of a station with the privileges of the operator class, or of the two operator classes in the case of a Dual-Class license when one of the classes is Novice and the other is either Basic or Technician, specified on the license. The license document or a photocopy thereof must be in the personal possesion of the licensee at all times when the person is the control operator of a station.

2. Subpart A, Paragraph 97.9(b), is replaced as follows:

A person holding a valid license specifying a Novice, Basic, Technician, General, or Advanced class, or a combination of classes prescribed in 97.9(a) for a Dual-Class license, who has properly filed with the FCC an application for a higher operator class, or an addition operator class, which has not been acted upon, and who holds a CSCE indicating that the

person completed the necessary examinations within the previous 365 days is authorized to excercise the rights and privileges of the higher or additional class.

3. Subpart B, Paragraphs 97.119(e) through 97.119(e)(6), are replaced or added as follows:

When the control operator is using privileges on the basis of holding a CSCE specifying new or additional privilege class or classes, an indicator must be included after the call indicating the particular class the privileges are being used under. The indicators are as follows:

(1) KN for Novice Class operator;
(2) AB for Basic Class operator;
(3) KT for Technician Class operator;
(4) AG for General Class operator;
(5) AA for Advanced Class operator;
(6) AE for Amateur Extra Class operator.

4. The text portion of Subpart D, Paragraph 97.301(a) is replaced as follows:

For a station having a control operator holding a Basic, Technician, General, Advanced, or Amateur Extra Class operator license:

5. The chart portions of Subpart D, Paragraphs 97.301(e) and 97.301(f) are combined (deleting the redundant header) into a new 97.301(e). The text portion of 97.301(e) is replaced by the text portion of 97.301(f). 97.301(f) is finally deleted.

6. In Subpart D, Paragraph 97.313(c)(2) delete "or Technician".

7. Subpart D, Paragraph 97.313(h) is added as follows:

No station may transmit with a transmitter power exceeding 50 W PEP on authorized VHF or UHF bands when the control operator is a Basic operator.

8. Subpart D, Paragraph 97.313(i) is added as follows:

No station may transmit with a transmitter power exceeding 5 W PEP on authorized SHF or EHF bands or above 300 Ghz when the control operator is a Basic operator.

9. Subpart F, Paragraphs 97.501(a) through 97.501(f), are replaced or added as follows:

(a) Amateur Extra Class operator: Elements 1(C), 2, 3(A), 3(B), 3(C), 4(A), and 4(B);
(b) Advanced Class operator: Elements 1(B) or 1(C), 2, 3(A), 3(B), 3(C), and 4(A);
(c) General Class operator: Elements 1(B) or 1(C), 2, 3(A), 3(B), and 3(C);
(d) Technician Class operator: Elements 3(A) and 3(C);
(e) Novice Class operator: Elements 1(A) or 1(B) or 1(C), and 2;
(f) Basic Class operator: Element 3(A).

10. Subpart F, Paragraph 97.503(b)(2) is replaced as follows:

Element 3(A): 40 questions concerning the privileges of a Basic Class operator license. The minimum passing score is 30 questions answered correctly.

11. Subpart F, Paragraph 97.503(b)(3) is replaced as follows:

Element 3(C): 40 questions concerning the additional privileges of a Technician Class operator license. The minimum passing score is 30 questions answered correctly.

12. Subpart F, Paragraphs 97.503(b)(4) through 97.503(b)(6) are changed in code number only, as follows:

97.503(b)(4) is taken from original 97.503(b)(3)
97.503(b)(5) is taken from original 97.503(b)(4)
97.503(b)(6) is taken from original 97.503(b)(5)

13. The chart portion of Subpart F, Paragraph 97.503(c) shall be updated to include new element 3(C) and modified element 3(A) with a question distribution to be determined by an appropriate process. It is suggested that the approximate distribution of Element 3(A) be retained and also copied into Element 3(C).

14. Subpart F, Paragraphs 97.507(a)(2) through 97.507(a)(4), are replaced or added as follows:

(2) Elements 1(A) and 2: Advanced or General Class operator.
(3) Element 3(A): Advanced, General or Technicial Class operator.
(4) Element 3(C): Advanced Class operator.

15. Subpart F, Paragraph 97.511(a) is replaced as follows:

Each session where an examination for an Amateur operator license, other than a Novice Class operator license, is administered must be coordinated by a VEC. Each administering VE must be accredited by the coordinating VEC.

16. Subpart F, Paragraph 97.511(b) is replaced as follows:

Each examination for a Basic Class license must be administered by 3 administering VE's, each of whom must hold an FCC-issued Amateur Extra, Advanced, General or Technician Class operator license.

17. Subpart F, Paragraphs 97.511(c) is taken from original 97.511(b).

18. Subpart F, Paragraphs 97.511(d) is taken from original 97.511(c).

19. Subpart F, Paragraph 97.511(e) is replaced as follows:

The administering VEs must make a public announcement before administering an examination for an Amateur operator license other than a Novice Class operator license. The number of candidates at any examination may be limited.

20. Subpart F, Paragraphs 97.511(f) is taken from original 97.511(e).

21. Subpart F, Paragraph 97.511(g) is replaced as follows:

Within 10 days of the administration of a successful examination for an Amateur operator license other than a Novice Class operator license, the administering VEs must submit the application to the coordinating VEC.

22. Subpart F, Paragraph 97.521(c) is replaced as follows:

Agree to coordinate examinations for Basic, Technician, General, Advanced, and Amateur Extra Class operator licenses.

2849. 2m GAASFET preamp needed

Newsgroup: rec.ham-radio
Date: 1989-09-24 13:15:21 UTC
From: gopstein@soleil.UUCP
Message-ID: <797@soleil.UUCP>

Now that I understand why my reception of Oscar-13 is bad during most of its orbit, I need to add a good mast-mounted 2m gaasfet preamp.

I am interested in recommendations about which models are good, and how to do T/R switching. The ARRL handbook has a couple of articles on T/R switches and sequence timers, but I was interested in real-life experiences.

The two options that I see are:

1. Buy a plain preamp and add my own T/R switching.

2. Buy a preamp with TR switching in it already.

I've talked to vendors of the Angle Linear (no switching), and the Landweir? (with swtiching). What are people's opinions of the various preamps on the market? Thanks.

> squint angle is. I assume it's when the antennas are

Squint angle, also refered to as Pointing Angle is the difference
between your location and the antennas of the satellite. Usually the Oscar
satellites have a few antennas for different uplink and downlink frequencies.
If these antennas are pointing directly at you than the pointing angle is zero.
Depending on the frequency you are using, especially for uplink the pointing
angle may or maynot be critical.

For example at 2 meters a squint angle of 40 to 50 is about max. Any
greater and your signal just doesn't do it. At 432Mhz 30 to 40 degrees, and at
1.2 Ghz a pointing angle of greater than 20 won't make it either. Of course
this depends also on your power and receiving ability, but I have found these
numbers work well for me.

These numbers are usually given with most computer sat. programs. It's
found under the column called PA.

Good luck - N1GCR

I'm lucky. My property is laid out in such a way, I can back the van up on the patio and run jumper cables into the shack thru the windows.

Chuck Worsham, W3PE, owns, or did own until he retired and turned it over to his son, a professional engineering firm that did of lot of meteor PING work. He said the ones they setup had the masters constantly polling the slaves. When a response was received (he used full duplex), they both dumped their traffic. He said 900 to 1000 km was very practical IF omnidirectional antennas were used. He said directional antennas reduced the number of useful trails "visible" at both locations.

In reference to FCC rules 97.107:

In the event of an emergency distrupting normally available communications facilities in any widespread area or areas, the Commission, in its discretion, may declare that a general state of communications emergency exist, designate the area or areas concerned, and specify the amateur frequency bands, or segments of such bands, for use only by amateurs participating in emergency communcation within or with such affected area or areas. [How to request and other communications not typed].
(a) All transmissions within all designated amateur communications bands other than communications relating directly to relief work, emergency service or the establishment and maintenance of efficient Amateur Radio networks for the handling of such communications shall be suspended. Incidental calling, answering, testing or working (including casual conversations, remarks or messages) not pertinent to constructive handling of the emergency situation shall be prohibited within these bands. (WD5B note: or specific frequency designated.)
(b) The Commission may designate certain amateur stations to assist in the promulgation of information relating to the declaration of a general state of communications emergency, to monitor the designated amateur emergency communications bands, and to warn non-complying stations.....

Why, considering the nature of this disaster, was an emergency specification not declared for those frequencies, plus and minus 3khz? Offending stations would then be in the position of interfering with communications within a Commission specified emergency band and in direct conflict with FCC regulations.

PL 103.5 enables order box speaker

Many outfits in the local area started out with gear by HME, buthave
switched to Motorola. I don't have a model number.

The "mobiles" can communicate with themselves with PL encode off, the
receiver in the order box hides behind PL. All in my area use 103.5 tone.

The "base" (outside order box) talks without PL to the "mobiles".

All radios are 2w or less.

My scanner found MacDonalds on 35.02, a friend claims 35.015,
take your pick.

There are frequencies in the 457-458 Mhz range (specifically 457.525
and 457.600) that I have heard similar traffic on but have not had
the time to determine the specifics.

In article <9@argate.UUCP> richard@argate.UUCP (Richard Duncan) writes:
] In the event of an emergency distrupting normally available communications
]facilities in any widespread area or areas, the Commission, in its
]discretion, may declare that a general state of communications emergency
]exist, designate the area or areas concerned, and specify the amateur
]frequency bands, or segments of such bands, for use only by amateurs
]participating in emergency communcation within or with such affected area
]Why, considering the nature of this disaster, was an emergency specification
]not declared for those frequencies, plus and minus 3khz? Offending stations
]would then be in the position of interfering with communications within a
]Commission specified emergency band and in direct conflict with FCC
]regulations.

I requested such a declaration for 14.325, and was advised by the FCC
watch officer in Washington:
(1) Because communications were not disrupted in South Carolina
(and they weren't until about an hour before the eye hit. I talked
to him 4 hours before it hit), they couldn't use this section (107).
(2) The frequency had already been declared an emergency frequency
under part 8 (anyone know what this is) by the Net manager (Jerry had
in fact done this several days earlier) and hence it was not necessary.

By the way, we had this declaration during Gilbert and it really didn't
seem to do any good. As far as I know, no one was prosecuted after
Gilbert as far as I know.

Folks - if we want to solve this problem, we're going to have to
do it ourselves! It's time to find and document the offenders BEFORE
they interefere with vital traffic!

>Charlie Thompson
>WB4HVD

A while back, I worked for a small division of Litton Industries,
and at the annual inter-division "technology transfer" seminars,
I met the chief engineer of Litton's microwave oven division.

In the course of casual discussions, I found out that a good way
to determine the "microwave wattage" is to use simple calorimetry;
put a measured amount of water at a known temperature in the oven,
and run it a measured time to produce a *small* increase in
temperature. The rest is left as an exercise for the curious...

He also said that they never used one of those expensive "leakage
meters"; they just bent the leads of a NE-2 out like a dipole and
went around the seal with it. No light, no leakage.

No responsibility if these things don't work, though.

2865. solar flares/magnetic declination

Newsgroup: rec.ham-radio
Date: 1989-09-25 02:23:28 UTC
From: ee5391aa@hydra.unm.edu
Message-ID: <605@ariel.unm.edu>
Source record: 16688

A friend of mine heard that solar flare activity can affect local magnetic declination by as much as +/- 5 degrees over a period of a few days.

We are curious about this, because those of us who survey caves frequently rely on magnetic instruments, rather than more accurate but much harder to use transits or theodolites.

Does anyone out there KNOW anything about this?

(Conjecture is fine, but please label it clearly.)

Minding inquires know want to,

=>I would suggest that this be under rec.ham-radio, and since dx'ing is
=>the common denominator (the local FM station is usually not of interest
=>to swls) a more appropriate name might be rec.ham-radio.dx-listening.

Ugh. Would anyone really want to memorize, much less type in a twenty
six character long newsgroup name? No, I think that rec.monitoring would
work out much better. (This would include the hobbies of scanning and
swl'ing as well.)

The suggestion was made that we should try rec.ham-radio.swl as well.
I believe that this is getting things sort of backwards. Would it be
logical/practical to start a new sub-group called radio (ie
rec.radio.xxxx)? This way we could have expansion room for a later date
if other radio topics start piling up in r.h-r. Groups would be
simmilar to:

rec.radio.ham
rec.radio.ham.market
rec.radio.ham.packet
rec.radio.monitoring
etc.

/* ---------- "New Part 97" ---------- */

I'd expected to see a lot of discussion by now of the new Part 97
recently published. But, I'm will to kick off the ball with what
I thought was a couple of very interesting sections.

| S 97.403 Safety of life and protection of property.
|
| No provision of these rules prevents the use by an amateur station
| of any means of radiocommunication at its disposal to provide essential
| communication needs in connection with the immediate safety of human
| life and immediate protection of property when normal communication
| systems are not available.
|
| S 97.405 Station in distress.
|
| (a) No provision of these rules prevents the use by an amateur
| station in distress of any means at its disposal to attract attention,
| make known its condition and location, and obtain assistance.
|
| (b) No provision of these rules prevents the use by a station,
| in the exceptional circumstances described in paragraph(a), of any
| means of radiocommunications at its disposal to assist a station in
| distress.

Opinions/comments?

/* End of text from uxa.cso.uiuc.edu:rec.ham-radio */

I have a questions regarding these rules. The rules say that "No provision
of THESE RULES..." [caps added] will stop us from doing stuff. However,
will OTHER rules stop us. The business about type-acceptance and who
is authorized to be on gov. frequncies is in other sections rules. So, where
do the rules stop in the event of an emergency. Clearly, in an emergency, I
could operate on amateur freqs. with too high power, cause deliberate
interference if that's the only way I can get attention, etc. But, are there
any opinions on just how far ranging this exception policy is?

SL>..Do you mean I can physically replace the 8250 on my serial board with
SL>..a 16550? Wouldn't there be some trouble with the difference between
SL>..edge and level triggered interrupts?
SL>..
SL>..Has anyone actually tried this, and how did the 16550 perform
SL>..compared
SL>..to the 8250?

Yes, it is very common practice on Fidonet systems running with a 19200 baud interface with the USR HST modems. Without the 16550 chips, some computers have trouble keeping up with the interrupt rate, resulting in lost characters, etc.
The procedure to change over is simple. Just get a 16550, pull the old chip out and plug the new chip in. Then obtain the software drivers, etc. that will access the special features of the chip.
I did that here on my landline BBS about 6 months ago or so and have had no problems. It enables my XT to keep up with the HST modem with the serial port locked at 19200 baud and saves significantly on the phone bill. Many other Fidonet mail hubs have done the same thing.

2873. Transmitting on Police Frequencies

Newsgroup: rec.ham-radio
Date: 1989-09-25 14:39:40 UTC
From: AXVSCCN@UICVMC.BITNET
Message-ID: <8909260707.AA02291@ucbvax.Berkeley.EDU>
Source record: 16711

The topic of transmitting on police frequencies during an "emergency"
is an interesting one. My suggestion is DON'T. Many months ago I posted
an article to this list about modifying radios for out-of-band operation.
In it I menioned the problems that can occur when radios that have been
programmed to transmit on police and EMS frequencies get lost or stolen.
I also mentioned that many hams have told me "in an emergency it's
perfectly legal to transmit on...". Despite your good intentions, most
police departments do not look too kindly on "outsiders" transmitting
on their frequencies. We have enough trouble around here with emergency
services agencies talking on each other's frequencies as it is. I know,
"seconds save lives", but I feel the cons outweigh the pros on this issue.
We have two autopatch facilities here in Carbondale with pre-coded
emergency numbers. Those numbers are available to anyone (even non-hams).
I would suggest other communities do the same thing. I also suggest that
all hams have their names and callsigns on file with their county ARES
and police department. I'm not saying don't ever use a police frequency.
Rather, protect yourself. Use all available alternatives (telephone, CB)
before you put your license and reputation on the line. What you feel
is an emergency may be just another routine call for the EMS people.
Why chance it?

See the new issue of _Sky and Telescope_ magazine, "Gleanings for Amateur Telescope Makers" column. It contains plans for a "Jam jar magnetometer" useful as an aurora alarm (possibly useful for hams), and graphs of magnetic disturbances during some recent magnetic storms.

Here's something that another caver relayed to me from comp.risks:

Date: Tue, 9 May 89 18:51:04 BST
From: Brian Randell, Computing Laboratory, University of Newcastle upon Tyne <Brian.Randell@ newcastle.ac.uk>
Subject: The Geomagnetic Storm of 13 March 1989

A colleague drew my attention to an article in Radio Communication (Vol. 65, No. 5, May 1989)... Below I excerpt from the article, without permission.

THE GEOMAGNETIC STORM OF 13 MARCH 1989

Ted Harris and David Kerridge, Geomagnetism Group, British Geological Survey, 29 March 1989.

"The largest magnetic storm for 40 years started at 2am on 13 March 1989... The intensity of the storm was such that the aurora borealis (northern lights), normally restricted to high latitudes, was seen clearly in the south of England, and there were reports of observations of the aurora in Italy and as far south as Jamaica.
"The rapid changes in the geomagnetic field during the storm induced voltages in power lines, transoceanic cables, and telephone and cable TV networks...
"Ionospheric disturbances caused disruption of radio communications and resulted in the loss of TV reception in some areas. Satellite communications were also affected - as were satellite orbits as the increased ionospheric density produced extra drag.
"The increased radiation at high level created such potential

hazards that a Concorde airliner on a transatlantic route took a more
southerly flight path to avoid subjecting its passengers to radiation.
Astronauts aboard the the space shuttle `Discovery' would have been
prevented from working outside the space craft because of the danger.
The shuttle mission was recalled a day earlier than planned because of
computer malfunctions which could have been caused by the storm.
"At sea-level, North Sea exploration companies reported that`down-
well' instruments, used to steer drill heads, had experienced violent
swings in compass readings of up to 12 degrees! A Norwegian
^^

geophysical exploration company reported that all surveying has been
halted after receiving warnings of the storm and its severity from
GRG. The director of operations reported that two navigation systems
used to fix the position of survey ships, which were in agreement
prior to the storm, were now diverging. GPS (Global positioning
system) satellites experienced increased drag which retarded their
orbits so much that positional accuracy at the Earth's surface was
lost. ...
"Solar activity is likely to peak during 1990 (Solar Maximum),
resulting in more magnetic storms and a generally high level of
magnetic activity over the next two years at least."

About a week following the hurricaine, I met a sked on a frequency within the 50 KHz (or whatever) "reserved for hurricaine traffic" area. Within minutes someone came along and explained the situation, I said "oops" and we dialed up the band. I expect this type of thing happened a lot. I don't think that the amount of legal action taken by the Commission is indicative of declaration's success.

I've usually been one to look the other way when I see/hear minor violations
of any kind-- I'm not the police. BUT, if the 3913 situation is as you say
it was-- MALICIOUS interference, I certainly would alert the FCC.

>
This is the best I've seen so far for a name. The question of enough interest seems academic at this point, so can someone who knows the protocols of such things post a reply to the following questions:

1. Is it possible to change the name of an existing group? (The idea seems to be to persuade the amateur radio enthusiasts that rec.radio.ham is an attractive name for their group, in the interest of uniformly named, (easier to understand) news groups).

2. Who must be consulted; is there a referendum mechanism?

In addition, is there support among the disputants for rec.radio.swl? It works for me, but then I am more concerned with the group than the name.

Later,
Andrew Mullhaupt

>
I agree. The FCC defines an emergency as a situation where "life or
property is in immediate jeopardy". In such situations, when normal
and otherwise legal means of communication have ben exhausted, one may
use *any* means available to summon help, without regard to the usual
rules of frequency allotment, power, spectral purity, etc.

Of course, one would want to first exercise the legitimate channels.
Also, when one is to use a police or fire net which is normally full
of other emergency traffic, one had better have good net protocol in
order to avoid jeopardizing others who are on frequency.

I've not had to do this yet. But if I had to, I would---without hesitation.

I would suggest that your friend look into ICOM commerical handhelds.
These radios can be modified to accept keyboard freq entry and
will work on the commerical band (legally) as well as the ham bands.
Regards,
Minor

In article <740@anasaz.UUCP> john@anasaz.UUCP (John Moore) writes:

}I should point out, though, that there must be tens to hundreds of
}thousands of hams listening to these nets during the emergencies
}that are to be commended for having the good sense to only transmit
}when appropriate. These folks are doing it right!

As one of the "silent majority" thanks, I am glad you do recognize that
despite all the harrassment. You will ONLY hear my call if NC SPECIFICALLY
asks for help which I can give - that is the only time to jump in and it
hasn't happened yet!

}By the way, as the only ham in Phoenix active in hurricane related
}activities, I often have TV reporters in my shack (they call me - I
}don't call them!). I am often embarrassed by what they hear over
}the radio (and sometimes what gets passed on to their listeners
}during live broadcasts)!

For all that the reports I (and others I have talked to) are VERY inpressed
by the coverage. Congratulations on a superb job!

}As far as the intentional jammers go, I think that these people need
}to spend a fair amount of time contemplating their activities in
}a federal penitentiary!
...
}Here in Phoenix, if we found someone
}jamming an HF emergency net, we would have him in jail in about
}30 minutes - due to an agreement with the local federal attorney.
}I suspect that most of these folks are long time offenders, and
}if we had adequate enforcement they would have been removed from
}the bands BEFORE they QRM vital traffic.

John, as you know I disagree with you on a lot of things, but here you are
RIGHT ON THE MONEY!

}I would try to get the national network going but really don't have the time.
}The ARRL doesn't (IMHO) give this enough priority. It is a natural
}outgrowth of the Volmon program, but neither the FCC nor the ARRL
}provide any real national coordination for these programs other than
}accreditation.

Again I agree 100%! Its too bad that is so, but it does seem to be a fact.

Notice though that this is NOT a vigilante program of wrecking people's
equipment etc.. This plan involves a lot of hard work, but undeniably CAN
be made to work. It is the only long term way of silencing these jokers
without giving them the excuse to claim they are being martyred or

persecuted for some reason.

2882. PACKETCLUSTER

Newsgroup: rec.ham-radio
Date: 1989-09-25 18:58:00 UTC
From: pescatore_jt%ncsd.decnet@GTEWD.AF.MIL
Message-ID: <8909260707.AA02544@ucbvax.Berkeley.EDU>
Source record: 16712

The Potomac Valley Radio Club has established a packet radio based DX spotting system on 2 meters in the Washington DC area. The system is easy to use and a big help to contesting and DXing. The system currently has six nodes:

W3LPL 145.59 GLENWOOD, MD
WOYVA 145.51 GREAT FALLS, VA
N2FB 145.57 LOTHIAN, MD
NE3H 145.57 CARLISLE, PA
N4SR 145.57 NORTHERN VA
KK4XO 145.57 WOODBRIDGE, VA

The KK4XO node is often crosslinked to the DCA NETROM node.

To use the system, simply connect to one of the nodes, and type SH/DX for the five latest putouts, or SH/WW to see the latest WWV propagation information. Type HELP to get information about other comands. The system is supported by its users; contact N2FB for information.

The Potomac Valley Radio Club is always looking for new members interseted in contesting and HF operating. The club meets once a month and meetings are open to all. Contact anyone on the 147.00 repeater, or WB2EKK @N4QQ or PESCATORE_JT%NCSD.DECNET@GTEWD.AF.MIL

TM321A Mars/cap mod
from WM8J msgID 2846_wa2rkn

To give the TM321 tx coverage from (142 0r 143, don't remember which) to
151.995 mhz, remove the top cover. Look for a loop of wire comming from the
display area (the board with the CPU) and going right back. Cutting this wire
and then doing a CPU reset is all you need to do. Takes about 2 minutes.
Be sure that the ends of the wire don't short to something.

I just bought a new FT-470. I am interested in ANY information
and Mods that are available. I will re-post all collected
info back to the net.

I already know the Extended RX mod.

I am interested to read about experiences with this radio
and packet operation. Any problems?

Also interested in full-duplex operation and pin-outs info for
mic-plug. (There are three conductors, yet speaker/mic only
uses two.)

2886. Icom <--> RS-232 Code (C) Stolen From GEnie

Newsgroup: rec.ham-radio
Date: 1989-09-25 23:21:45 UTC
From: pff@thumper.bellcore.com
Message-ID: <1724@thumper.bellcore.com>
Source record: 16700

Recently, I recall someone was looking around for some code to control a
Icom rig via RS-232. Following is a file I just grabbed from GEnie to
do just that (so the poster claims). While I lost the posters name, it
appears as if the authors name is in the code. I take no blame or credit
for this code.

Here's lookinatcha!

```
/*
icom.c
frajr
02-28-89

I have an Icom-735 and have been messing around with the RS-232 interface.

There are a few text files with information about how to build an interface
for the Icom RS-232 connection. I found two on Compuserve in the HAMNET SWL
section.
If you don't hve access to Compuserve, and or can't find information I'll try
to send replies to an SASE.

This short function simple monitors the data that comes from the ICOM RS232
interface all the time, wheither you want it or not.

Type Icom to start the small monitor program.

A station ID file is opened on drive a: during the start of the file. I have
some
desire to collect data, either QSL info or latitude, longitude, satellite
parameters, etc in the future. A disk must be in the A: drive
for the program to run.

Pressing enter will kill the program and close the station ID file.
Using the same disk the next time will prevent being asked for
the callsign. It is read from the disk.

Obviously not a major step forward and not a major program. I'm only playing
with some functions learning how to use the ICOM interface. I someone needs
something particular, please write and/or call. It might not get done but
at least I'll know what you need!

My Magic Chef service manual specifies a procedure to do this. A measured
amount of water is nuked for a specific period. The change in temperature
(delta t) is then plugged into a formula resulting in calories of energy
which you can convert to watts. Consult an applied physics book or I can
look it up for you.
Better yet, convert that thing to a high power FM 2.5 Ghz transmitter and
nuke the neighborhood! Plans are available in a recent issue of 73 magazine.
The same author originally presented the project in RF Design magazine where
he won 3rd place in the design contest (shoulda been first). With plenty
of MDS pirate receivers/antennas around you can probably gain an audience.
Are there any MDS broadcasters left? They shut off the one in this area.
It was a good signal source for microwave receiver projects.

Two thoughts. The PK-232 is not flexible enough to copy all
RTTY modes that exist. For example Civil Air Patrol sends
VHF RTTY with an 850 khz shift, which does not quite match
the wide mode of the PAKRAT. Sometimes the signal is sent
inverted, so try that option. PC-PAKRATT has a toggle to do that.

Re FAX. I have a pakratt and AEA's PC-FAX software connected to
a pc with an ega and a 2010. I have been able to copy
NOAA's weather transmissions and later print them and they have
been quite acceptable. I have never been successful connecting
a printer directly to the pakratt, most likely because I have
HP computer peripherals. NOAA transmits fax in a regular schedule
from several transmitter sites. Contact me if you want to know more.

This may not be quite true. Every so often I read reports of the FCC
cracking down on backpackers and similar folks who carry aircraft ELTs
with them in case they get lost in the wilderness. Apparently, even
though the intent is to use them only in an emergency, the FCC says
ELTs are for aviation use only. I wonder if being a ham would make
any difference here...

>
> Hi! I need some advice from some insightful HAMs on how to set up
> an effective antenna system. The problem is that I live in a 12 storey
> apartment building with no balconies on the seventh floor and I am not
first, effective is all relative....i strung up a 110 meter dipole
in my ground floor apartment and worked many countries and 49
states...with a converted cb....so with the sunspot cycle at or
nearing its best....try anything and don't get discouraged. in
fact i suspect 15 and 20 meters can be fun with an indoor dipole.
Also, a friend just bought one of the new verticals from hygain or
cushcraft with the short ground plane radials on it...needs no
ground...and has been very pleased with it....its expensive, but he
just has it on a porch.....on a railing....do you have a balcony at all?

> good as ever - however they have an RCA connector on the back for the
> antenna connection. Does any one know the easiest way to hook this
> up to some RG-213/u co-ax or should I invest in some thinner co-ax?

either just replace the rca connector or make a rca to pl239
adaptor with coax or perhaps even someone buys one? depending on
how far your antenna is from your coax...use 58u....only on 15 and
10 will it matter significantly, and then only if your antenna is a
ways from your tx....for a 25 to 50 foot run....go for it....in an
apartment, everything is "relative". There have, by the way, been
a number of good articles on apartment operating. Don't let some
one convince you your operating days are "short" because you cant
put up a 3 element beam....

only word of caution is TVI....apartments can bring this out n a
big way....low power may be needed due to proximity to your
neighbors.

finally, on 80 meters...can you string a "long wire" out with some
sort of pole so that it gets away from your building....may be fun
at night when the extended pole won't be seen. depending on your
rules, you may be able to leave it out...use thin wire and the
antenna is essentially invisiable.....
use a guner and go for it.

What do you think the police would say if, even during a true
emergency. you started calling for help on a police frequency,local
DEA freq, towing service? I would bet they would tell you to get off
the frequency. Think the radio op's know about the FCC, doubt it.

I got email from the gentleman who called me. Really enjoyed it
(and I promise I'll reply RSN! :-)

>I will start at approx 1500Z (9am Colorado local time) and continue
>until whenever.

Well, I managed to start at almost exactly 1500Z (9am colorado) and lasted
until 1545Z. I talked to one gentleman (sorry, I left your call at
home!), and he spoke to someone else. So, I've got one state
toward my usenet WAS now, watch out world! :-) I had a good time,
and thank my one contact for being there. (however, this being my
second day on the air, and my first day calling cq, I can say is I
much prefer to scan for people to talk to than to sit and call CQ!)

Was anyone else on? I could hear the East coast very well (in fact,
when I called CQ, the first time there was no answer, the second I
almost lost my hearing when the reply came back! QUICK, WHERE'S
THAT AUDIO VOLUME??????? :-)), did any one else have any luck?

Is 1500Z a bad time for everybody?

As you can see from my .sig, I plan to keep this up for a while :-)

Looking forward to hearing from YOU on 10m!

P.S. sorry for posting the previous announcement of time, freqs, etc
so late. I heard on Sunday that people at HP in Ft. Collins had

not yet gotten the news...

Having been in my checkered youth a police/fire/rescue dispatcher, I can tell you right now it is a total waste of time. Your transmision will be considered to be not only a hoax, but very likely done with malicious intent. Sticking to the conventional solution will morelikely produce better results. Sorry, but those are the realities.

I am interested in building a system to receive WEFAX APT
pictures from at least the polar orbiting weather satellites
and maybe also from the geosynchronous ones. One question
I have is: what is a good receiver to use? I have a scanner
that can receive 137.5MHz but it's bandwidth is either 6kHz or 200kHz.
I understand that the appropriate bandwidth would be about 50kHz.

What do other experimenters do in this regard?

P.S. - I would expect to receive the GOES satellites with a down-converter
to the 137 MHz range, so the same receiver could be used for both.

Anyone comtemplating converting a microwave oven into a high power transmitter should have more worries about his own health than his neighbors. In the far field (say 100ft) of a 10 degreee beamwidth antenna (several foot dish) running 500W of rf power the field strength would be less than 0.5mW/sq.cm. This is (I believe) within recommended exposure limits and would pose no health threats (though I wouldn't want to spend 24hrs a day, 365 days a year in such an environment). More of a problem would be stray rf in the shack. If anyone is contemplating this conversion (and yes, it can be done) they had better know what they are doing and have some kind of rf field strength monitor around. There is no doubt that exposure to high levels of microwave energy can cause cataracts. The evidence for inducing cancers is somewhat less certain, but its not something I would want to completely ignore. Be Careful. Microwaves are quite friendly if you know how to treat them right, but they can bite if you don't.

2904. I chose the Ten-Tec Paragon

Newsgroup: rec.ham-radio
Date: 1989-09-26 19:50:47 UTC
From: parnass@cbnewsc.ATT.COM
Message-ID: <3484@cbnewsc.ATT.COM>
Source record: 16630

x
Last July, I asked for comments from users of these HF
transceivers:

Kenwood TS-940S
Ten-Tec Paragon
Icom IC-765/761

The comments were useful in deciding which HF rig to get.
I've owned the Drake 4A line, a Drake TR-7, TR-7A, and
R-7, and would have bought a TR-8 if Drake saw fit to
sell one.

Last Saturday I bought a new Ten-Tec Paragon and 961
power supply from a dealer (The Ham Station) at a local
hamfest. I suppose that the Paragon comes closest to
what a Drake TR-8 might have looked like.

Since I repair and update my own equipment (and that of
other hobbyists), it was important to have a radio that
was easily repairable and lent itself to modification.
The Paragon has lots of room inside and uses conventional
components, not surface mount (lick 'n stick) parts. You
don't have to pay extra for a shop manual. It comes with
a large operating/technical manual, containing schemat-
ics, PC board layouts, and circuit descriptions (but no
alignment information).

A good full break in cw system (QSK) was another key cri-
teria. The Paragon full break is superb, and the speech
processor sounds good also. So far, I am pleased with
the radio and its optional 1.8 kHz and 250 Hz filters.

There were two minor problems with my new Paragon:

1. I had to realign the 32+ kHz oscillator so the clock
could keep accurate time.
2. The foam packing stuck to the insides of the ship-
ping box so I had to use a knife to cut the foam
away and extract the radio. A plastic sheet was
supposed to prevent this from happening, but the
sheet was not properly positioned when the foam was
sprayed in. There were no effects on the radio
itself, as it was completely protected by another
plastic bag.

I do wish the Paragon used a permanent memory system like
the Omni V instead of a 9 volt backup battery. Oh well.

Thanks again for the comments about your radios.

I agree. I should have added in my posting that I am strongly against this except when 1) absolutely all other reasonable means of communications have been exhausted, and 2) it is an immediate life and death matter (I'd not do this for a property matter, even though the rules seem to permit it). And then, I would keep it short and simple, and try to conform to their lingo/procedures to the extent possible (e.g. keep transmissions short).

If such a situation is handled with this kind of judgement and professionalism, I'd think any agency would be hard pressed to make too much trouble for you. BTW, generally all radio traffic is taped by PD's.

<The PK-232 is not flexible enough to copy all RTTY modes that exist. For example Civil Air Patrol sends VHF RTTY with an 850 khz shift, which does not quite match the wide mode of the PAKRAT.>

(I think you mean 850 *Hz*, not *kHz*, right?)

The PK-232 will copy 850Hz shift just fine. As I recall, the detector is simply a dual-slope discriminator, and all WIDESHIFT does is increase the bandwidth of the preceding "roofing" filter. In other words, WIDESHIFT means "all shifts between 120 Hz (or so) and 1.2 kHz (or so)", whereas WIDESHIFT OFF reduces the signal passed to the discriminator (and thus also the noise) to somewhat more than 120 Hz bandwidth.

This is explained quite clearly in the FAX portion of the manual. Anything over ~1800 Hz is a one, anything below is a zero. (Or vice-versa, I don't have the manual in front of me.)

My wife, N6KIM, and I will soon be travelling to Japan for a
couple of weeks. I've heard about the amazing concentration of
electronics stores in Tokyo in Akihabara and Shinjuku areas.
But, where are the ham radio stores? Can anyone provide names or
addresses (and subway stops)? I'm not planning to buy anything,
but I do want to look!

Tnx in advance--Jim, K6ZH, ARPANET: PRICE@NOSC.MIL

2909. ICOM HT in the UK

Newsgroup: rec.ham-radio
Date: 1989-09-26 22:03:00 UTC
From: jsb@hpfinote.HP.COM
Message-ID: <16170007@hpfinote.HP.COM>
Source record: 16635

A co-worker is heading for the UK in the coming week and wants to take his ICOM 02AT. I understand that a lot of the repeaters use a 1750Hz CTCSS tone. Can anyone lend a hand how to add this to a radio built for the US market? Does the UT-40 add-on board produce this tone?

He has the reciprocal agreement in hand, and just heard about this PL tone.

If anyone has receive mods for this unit he is also interested in them.
Thanks !!

I have a friend on St. Croix that I have not heard from
since the hurricane hit. He lives in an area that, according
to the State Department, "suffered a lot of destruction".
Telephone service to that area is still out. Western Union
is recommending Mailgrams, but that requires a cable office
on the island, which they say is still not operational.
I would appreciate any help that anyone could give me.

2911. Re: Transmitting on Police Frequencies

> Why chance it?

The above is very sound advice, and I would urge any ham with an out-of-band transceiver to not even THINK about using it to contact any police department. It is far more probable that - right or wrong - such a transmission on a police frequency will turn you into a villain, and not a hero.

My perspective on this topic comes from personally being familiar with the law enforcement community, and from having a wife who worked as a police officer and investigator with a local law enforcemet agency for several years.

Police departments are generally overworked and understaffed, and they have little patience with citizens who want to "play policemen". An example of a growing problem is the commonplace use of cellular telephones. While lives have indeed been saved and criminals apprehended through the efforts of motorists using a cellular telephone to contact police, a spate of false and nonsense calls has also resulted. There are, unfortunately, some people who use their cellular telephone to dial 911 at the slightest provocation - like another motorist tailgating - and who DEMAND immediate police response as if a violent felony were being committed.

There is no smiley in the above paragraph because it isn't funny, it's incidence is increasing, and it is creating, shall we say, a "bad attitude" on the part of some police departments when they receive a celluar telephone call from a motorist.

Now, bearing in mind the above situation, picture a veteran police officer working in a radio room and handling complaints who all of a sudden hears from his console on his own frequency, no less: "This is

Amateur Radio Operator WXXX reporting an auto accident at Main and Pine strees, over." Chances are, this is one cop who is going to go apeshit. Oh, he'll dispatch a car and possibly an ambulance to the scene allright, but I would not want to be the amateur radio operator in question. I'll wager even money that he gets his radio confiscated and gets charged with some criminal offense.

Why? Because if a police department lets even one amateur radio operator get away unscathed with such an act, then they will be setting a precedent which will encourage untold numbers of amateur radio operators to do the same thing. The cellular telephone situation is bad enough; can you picture what would happen if open season were in effect established so that any amateur radio operator "thinking emergency" could utilize and more likely than not, disrupt police radio communications?

Another point I would like to clarify is that some amateur radio operators (in New York State, at least) are under the false impression that the laws which prohibit receivers capable of receiving police frequencies from being in motor vehicles do NOT apply to them. The difficulty arises because such an incorrectly informed person fails to FULLY read and understand the applicable law. In the case of New York, under Vehicle And Traffic Law Section 397, the exemption applies only to equipment which is "on frequencies exclusively allocated by the federal communications commission to duly licensed radio amateurs." An interpretation of this law which has been upheld is that it does NOT permit an amateur radio operator to have a scanner in a vehicle, since such scanner could also receive police frequencies. In a successful defense, one would have to demonstrate that the scanner was INCAPABLE of receiving police frequencies - an unlikely situation, especially if the scanner was also confiscated by police as evidence. Other case law for this section has made it apply to portable devices, even though they were not physically attached to the vehicle. Further case law has established that the New York law is constitutional and does not attempt to usurp any power of the FCC.

This has all been appellate case law, which means two things:
some amateur radio operators have done some pretty stupid things to incur their prosecution on this charge, and such amateur radio operators have also spent a lot of money to appeal their convictions. I would also like to point out that in New York State, violation of this law is not some minor traffic infraction - it is a gen-u-wine misdemeanor.

You should be ashamed of yourself Jeff. You may never cause
interference deliberately! Let me repeat it again:

CAUSING DELIBERATE INTERFERENCE IS _ALWAYS_ FORBIDDEN! EVEN IN AN
EMERGENCY! THOU SHALT NOT CAUSE INTERFERENCE TO ANY STATION
(IN ANY SERVICE) INTENTIONALLY!

You should know this Jeff. This was on the novice exam. You are at
least a technician (I assume; I couldn't find you on the callsign
server). Please, DON'T EVER PURPOSELY CAUSE INTERFERENCE, and don't
tell others that it's ok to do so. It has always been illegal, and
I expect it always will be.

I am a member of a university amateur radio club. We have many
student studying international relations and Russian, so I was thinking
it would be fairly neat to try to contact a Soviet youth or college
amateur radio station to discuss various topics (perhaps have about
5-8 people on both sides, with hams running the radio equipment and
moderating the discussion).
So, here are a couple of questions:
1) Do we have a third party agreement with the USSR?
2) If not, is there some authority I can contact to try to get an
exception for this kind of non-profit, educational activity?
3) Let's say this is actually legal. Does anyone know of Soviet
college age youth or college clubs? Does anyone have a regular
schedual with a Soviet citizen who might be able to find one?
4) Any other comments or suggestions?

Someone correct me if I'm wrong, but I don't believe the FCC rules section about use of any available frequency in an emergency is new with the rewrite -- the rules always contained some statement to this effect. The rewrite may have clarified the language, but that's all.

Also, I believe the rules for other services contain the same statement. I used to be quite familiar with the marine (boat, not soldier) service rules, and they certainly did.

> to be not only a hoax, but very likely done with malicious intent. Sticking to
----
> the conventional solution will morelikely produce better results. Sorry, but
----
> those are the realities.

I interpret your statement "sticking to the conventional solution" to be
something like "use the telephone and call 911 or the appropriate number".
FCC rule 97.403 says "...when normal communications systems are not available."
I think we are trying to talk about the case when this rule applies, that
being when the "conventional solution" is not possible.

What if you are out in an isolated area. No homes are nearby, your vehicle
and another were involved in a collision. Both vehicles are non-functional.
You are relatively uninjured, but another party is critically injured and in
immediate life threatening danger. Your radio works, and regardless of the
reasons it came to be this way, WILL operate on the police dispatch frequency.
Do you choose instead to walk (perhaps many miles) to seek help instead of
picking up the radio? I would be on the radio even if there was no 97.403.

But, I could call a ham radio operator and ask them to phone the police,
and then they would more likely believe it. This may not always be possible.
Many times, I've heard stories of hams finding 2 meters dead at 3 am in the
morning, and had to use..... CB!

I will use the best means at my disposal. If that is limited to barging in
on the police channel, then I won't hesitate.

READ FCC RULE 97.403 !!!! (better yet, I'll type it in again)

97.403 Safety of life and protection of property
No provision of these rules prevent the use by an amateur station of any means
of radiocommunication at its disposal to provide essential communication needs
in connection with the immediate safety of human life and immediate protection
of property when normal communication systems are not available.

> You should know this Jeff. This was on the novice exam. You are at
> least a technician (I assume; I couldn't find you on the callsign
> server). Please, DON'T EVER PURPOSELY CAUSE INTERFERENCE, and don't
> tell others that it's ok to do so. It has always been illegal, and
> I expect it always will be.

Jeff has it right in the first place. If a LEGITIMATE EMERGENCY exists, and
the only way to get communications through would violate other rules (as
97.403 refers to) then they are EFFECTIVELY SUSPENDED for that communication
by 97.403. 97.403 does NOT say that the "intentional interference" rule
is somehow especially sacred and supercedes all emergencies.

On host vmd.cso.uiuc.edu (128.174.5.98) you can get the Hugo pictures. Eric Roskos has uploaded through HUGO36.GIF. To access the space where the pictures are, do a "cd phil.515" or "cwd phi.515" command. A dir command will show some odd numbers for file sizes that do NOT reflect the number of bytes. Use BINARY or IMAGE modes for all transfers of GIF or EXE files from here; it is an IBM EBCDIC system, and translates EBCDIC to ASCII of you don't. Since the files are numbered 1 through 36, you might want to prepare an ftp script in advance to load them all (that you don't yet have) so you can run it in the background.

2921. Is ST. JOHN Still THERE?????

Newsgroup: rec.ham-radio
Date: 1989-09-27 04:29:57 UTC
From: flash@lopez.UUCP
Message-ID: <817@lopez.UUCP>
Source record: 16637

A friend of mine, knowing I am a ham operator, and having followed my discussions last year about GILBERT, has turned to me for help. She has friends on St. John, and has heard NOTHING from them since the hurricane (HUGO) took out all communications.

We were instructed to put all health and welfare inquiries into the local NTS system, for eventual delivery to the islands. Pardon me while I say this is fruitless. I have been listening to the nets, and I find that they are pretty well not taking much as far as incomming traffic, and I know my message would be lost in the shuffle.

I am tuned to 14.275, 14.303, and the rest. Even 14.313, where the controvercial HERBIE (of WAR ON 313 FAME) lost his antennas his house and car (and unfortunately some of the QRM'ers cheered)...

I hear no mention of St. John.

I am concerned mainly about Cruz Bay. Does anyone know anything about this area, damages suffered, and possible ops and scheds?

ANY HELP AT ALL GREATLY APPRECIATED...

If you are interested in in-depth evaluations of the top of the line receivers, I recommend the series of RDI (Radio Database International) papers. They are available from Universal Radio, EBI (?), etc. They cost about $4-$5 per radio and are about 20 pages long. These are *not* the typical "Gee wizz, best thing since sliced bread" review you find in the mags (as in, what a nice radio please buy more ad space) but rather thoughtful and critical reviews.

I was considering getting a 525, so I purchased the papers on the 525, the R-5000, and the Icom and Yaesu receivers. I also got an owners and a service manual for the 525 at the same time - Universal has both for all the receivers. What I read convinced me to get the Kenwood R-5000 instead of the 525. ; this was a judgement call and your milage may differ. Perhaps it was the repeated references to the 525 as "hissy'. My Collins S-line had that problem and I grew to hate it, finally rebuilding the front end.

I am very happy with the R-5000, and would recommend it to anyone. It isn't cheap, but it's a excellent receiver. One caution. If you listen to AM, add the cost of the optional 6Khz filter in the price when you're evaluating. The stock AM filter is a piece of garbage, unless you like to listen to three stations at once -- it's at least 20 Khz wide, not useful with 5 Khz channel spacing on SW. The replacement filter is a drop-in 3 min install. (If you're a CW person, you'll probably want the 500 Hz optional CW filter. It's installation will make you very familiar with your 5000, as you have to disassemble a fair portion to solder the CW filter in.)

>that can receive 137.5MHz but it's bandwidth is either 6kHz or 200kHz.
>I understand that the appropriate bandwidth would be about 50kHz.

The 200 kHz bandwidth should work just fine, if you can get the noise
figure low enough to get an acceptable received signal with that wide
an IF bandwidth. It's only a 3 dB difference in the AF signal (factor
of 4 in voltage level is factor of 2 in power).

ARRL DIRECTOR AND VICE DIRECTOR ELECTIONS

The ARRL Election Committee has completed its examination of nominating petitions filed by members in seven Divisions for ARRL Director and Vice Director for two year terms of office beginning January 1, 1990.

The following candidates are unopposed and so were declared elected without balloting.

PACIFIC DIVISION Director: Rodney J. Stafford, KB6ZV

SOUTHEASTERN DIVISION Director: Frank M. Butler, W4RH

GREAT LAKES DIVISION Vice Director: George E. Race, WB8BGY

PACIFIC DIVISION Vice Director: Charles P. McConnell, W6DPD

Ballots were ordered mailed to full members in six Divisions, as follows:

ATLANTIC DIVISION For Drector: Hugh A. Turnbull, W3ABC
Robert B. Weinstock, KN1K

For Vice Director: Kay C. Craigie, KC3LM
James M. Mozley, W2BCH

DAKOTA DIVISION For Director: Richard P. Clem, W0IS
George E. Frederickson, KC0T
Howard B. Mark, W0OZC

DELTA DIVISION For Director: Joel M. Harrison, WB5IGF
Arthur P. Kay, W5APX

For Vice Director: James A. Amundson, W5TRD
Henry R. Leggette, WD4Q
John M. Wondergem, K5KR

GREAT LAKES DIVISION For Director: Leonard M. Nathanson, W8RC
Allan L. Severson, AB8P

MIDWEST DIVISION For Director: Paul Grauer, W0FIR
Robert S. McCaffrey, K0CY

For Vice Director: Lyndell C. Miller, WA0KUH
Laurance S. Staples, W0AIB

SOUTHEASTERN DIVISION For Vice Director: Evelyn D. Gauzens, W4WYR
Alan H. Page, KE4WO

There is no candidate for Vice Director in the Dakota Division.

In the six divisions where there are contests, ballots are being mailed to Full Members as of September 10. Ballots must be returned by noon, November 20.

ARRL LETTER - Volume 8 Number 19 - September 22, 1989 - Part 2 of 4

HUGO STRIKES CARIBBEAN

Hurricane Hugo, showing wind strengths of up to 140 miles per hour, slammed into the Leeward Islands on September 17 and began its march across the Caribbean toward Puerto Rico. Many of the first reports from the affected islands were from Amateur Radio stations. Emergency traffic nets were set up and awaited information from these stations on three main 20 meter frequencies.

The ARRL sponsored International Assistance and Traffic Net (IATN) at 14.303 MHz, the Friendly Carribus Connection on 14.283 MHz, and the International Amateur Radio Network provided front line communication as amateur stations in the affected areas reported in with damage assessments and assistance needs. The Hurricane Watch Net on 14.325 MHz kept in touch with the storm's progress. A net on 28.450 MHz was also instrumental in providing damage assessment reports from Puerto Rico.

W1AW reverted to an emergency operating schedule on Saturday, September 16. Informational bulletins were sent out and the station monitored on-the-air activity. Field Services Manager Rick Palm, K1CE, headed up HQ operations. Rick contacted the US Office of Foreign Disaster Aid and the National Red Cross in Washington DC to let them know of our availability in preparation for the storm. ANERCOM members Joel Kandel, KI4T, of Miami and Geri Sweeney, N4GHI, of Alexandria, Virginia, were also vital in organizing the first ARRL response.

W1AW had the opportunity to check into IATN and the net on 28.450 MHz, which served the needs of Spanish speaking amateurs in Puerto Rico. The HQ

staff was assisted by Jose Santiago, a representative of La Casa de Puerto Rico of Hartford, who translated damage reports for the HQ staff. Contact with the net was maintained for several hours after the net controllers asked for assistance from the US mainland.

ARRL made telephone contact with Puerto Rico Section Manager Alberto Valldejuli, WP4CSG, on Tuesday afternoon and by Wednesday, an emergency network on 28.450 was announced for messages going into Puerto Rico. Health and Welfare traffic was also being passed on 14.270 MHz for any affected location. At press time, hurricane-related traffic is also being handled on numerous other frequencies and via packet radio.

The American National Red Cross asked the Dayton Amateur Radio Association to form a jump team to accompany Red Cross officials to the U.S. Virgin Islands. Ron Moorefield, W8ILC, informed HQ that Dave Morris, N8EEK, and Bob Reckner, W8IQJ, were scheduled to travel with a complete portable station including an electric generator.

CONGRESS MOVES AHEAD WITH LICENSE FEE PROPOSAL

Discussions in Congress about possible fees for Amateur Radio licenses have alarmed many ARRL members. The ARRL position on license fees was reported at minute 83 of the July ARRL Board meeting and in ARRL Bulletin number 40. Fees were simply under discussion in Congressional Committees and there was no bill before Congress proposing them.

On Wednesday, September 20, while many amateurs were using their licenses to provide emergency communications in the wake of hurricane Hugo and others were preparing for it to hit the mainland later this week, a budget bill containing a license fee proposal was introduced into the House as HR 3299.

Action is expected in both houses of Congress early in October. ARRL members wanting to express their opposition to the Amateur Radio license fee aspects of HR 3299 will want to contact their Congressional representatives without delay. Senator Carl Levin of Michigan hs indicated a desire to work with amateurs to defeat the license fee proposal.

FCC RELEASES ERRATA LIST IN PART 97 REWRITE

On July 19, ARRL submitted a Request for Issuance of Errata List to the FCC in the Part 97 rewrite proceeding. It was submitted to "change the rules which were, in the League's opinion, unintentionally changed; where typographical errors were made; or where errors of omission appeared."

FCC responded with its Errata list released on September 7. After a review of FCC's corrections list, ARRL Executive Vice President David Sumnr, K1ZZ, said in a letter to the Directors, "This satisfies some, but not all, of the concerns expressed in our request for the issuance of errata."

Rick Palm, K1CE, Editor of the newly rewritten FCC Rule Book, said that the Errata will be included in the appendix of the Rule Book.

ARRL LETTER - Volume 8 Number 19 - September 22, 1989 - Part 3 of 4

PETITIONS FILED TO AMEND PART 97

On September 14, FCC issued a Public Notice listing filings from ARRL and eleven other petitioners for amendment of FCC's Part 97 Rules. ARRL along with six other petitioners filed for the creation of a codeless class of amateur license. Two petitioners filed for a change to the code speed requirements. Two others filed to restructure amateur operator licensing requirements and operating privileges and one petitioner filed to eliminate all license classes. The ARRL petition was designated RM-6995.

Interested persons have 30 days to file comments opposing or supporting these petitions with the FCC. The full text of these documents are available for viewing and copying in Room 239, 1919 M Street, NW., Washington, DC or may be purchased from the Commissions's copy contractor International Transcription Service (202-857-3800).

SCOUTS ON THE AIR OCTOBER 21-22 DURING WORLD SCOUT JAMBOREE

Here is an opportunity to introduce Amateur Radio to the Scouts in your area during the 32nd Jamboree on the Air (JOTA).

Boaand Girl Scouts and Amateur Radio operators the world over will communicate with each other using the amateur bands during the event.

Sponsored by the World Scout Bureau, Geneva, Switzerland, JOTA will run from midnight Friday through midnight Sunday (local time) during the the weekend of October 21-22. World Scout calling frequencies are:

Voice -- 3.940 7.290 14.290 21.360 28.350 MHz.
CW -- 3.590 7.030 14.070 21.140 28.190 MHz,

plus the RTTY, SSTV, and packet-radio sub-bands. Look for K2BSA, BSA HQ Amateur Radio station in Dallas Texas, K2BSA/6 in Ridgecrest CA, K2BSA/0 in Boulder CO, K2BSA/1 in Boston MA and HB9S, World Scout HQ ham station in Geneva.

Amateurs are encouraged to contact their local Girl or Boy Scout councils (see the White Pages) and offer to put on a demonstration. Special Amateur Radio/Scout brochures are available from ARRL HQ to hand out during the Jamboree. For more information contact Rosalie White, WA1STO, at ARRL HQ.

FEMA OFFERS EMERGENCY PREPAREDNESS GUIDE

"Millions of Americans Have Experienced Disaster - Are You Prepared?". This is the title of the July 1989 publication offered by the Federal Emergency Management Agency (FEMA). This 18 page booklet reviews the Civil Defense organizations in the country, how they work in times of natural and man made disasters, and heightens public awareness of the value of such an organization in their communities. At the end of the brochure is a list of additional "Self-Help" publications such as "In Time of Emergency - A Citizen's Handbook," "Planning For Survival" and "Emergency Preparedness Checklist." An order form is included.

FEMA is responsible for a wide range of emergency planning and response activities. They work with state and local governments as well as national

organizations to help communities plan for emergencies of all types.

"...Are you Prepared?" may be obtained at no cost by writing to: FEMA, PO Box 70274, Washington, DC, 20024.

ARRL LETTER - Volume 8 Number 19 - September 22, 1989 - Part 4 of 4

PART 97 RULES COVERING INTERNATIONAL RADIOCOMMUNICATIONS

The FCC has issued a Public Notice concerning communication with amateurs in foreign countries. Here is a recap.

- Permissible countries: Section 97.111 states when the administration of a country objects to its amateurs contacting US hams, it becomes a "banned country." Currently there are no banned countries.

- Prohibited transmissions: Section 97.113 says that communications for the purpose of facilitating the business or commercial affairs of any part is prohibited. Use of amateur communications as an alternative to other broadcast, common carrier, maritime, land mobile or other authorized radio services is also prohibited.

- Third-party arrangements: Section 97.115 "...authorizes an amateur station licensed by the FCC to transmit messages for a third party to any amateur station within the jurisdiction of a foreign government whose administration has made arrangements with the United States to allow amateur stations to be used for transmitting international communications on behalf of third parties."

Countries that have made the necessary arrangements with the US to permit third-party messages are: Antigua and Barbuda, Argentina, Australia, Belize, Bolivia, Brazil, Canada, Chile, Colombia, Costa Rica, Cuba, Dominica, Dominican Republic, Ecuador, El Salvador, The Gambia, Ghana, Grenada, Guatemala, Guyana, Haiti, Honduras, Israel, Jamaica, Jordan, Liberia, Mexico, Nicaragua, Panama, Paraguay, Peru, St. Christopher and Nevis, St. Lucia, St. Vincent and the Grenadines, Sierra Leone Swaziland, Trinidad and Tobago, United Kingdom (special event stations with call sign prefix GB followed by a number other than 3), Uruguay, and Venezuela.

United Nations stations 4U1ITU in Geneva, Switzerland and 4U1VIC in Vienna, Austria, have also made arrangements with the US to permit third-party communications.

FCC ENFORCEMENT ACTIONS

In conjunction with the San Francisco FCC Field Office, the US Attorney's Office in Fresno, CA, has initiated a second criminal prosecution against Donnie Ray Johnson, doing business as Red Monkey Communications in Fresno, CA for the marketing of illegal Citizens Band (CB) radio equipment. On August 14, 1989 engineers from the FCC San Francisco Office, along with US Marshals, conducted a search and seized $2000 worth of illegal CB linear amplifiers.

In 1985, Mr. Johnson was convicted for the same offense and was fined $5000 and placed on 2 years probation.

Johnson's prosecution is part of a continuing enforcement program to assure that the FCC ban on manuafacturng and selling CB linear amplifiers and other non-type accepted transmitters is observed. Federal law (47 USC 302 (b)) prohibits the marketing and manufacture of such non-compliant electronic equipment. A second conviction for violation of this law carries a maximum fine of $100,000 and/or two years imprisonment.

In another action, US Marshals and investigators from the San Fransisco Office of the FCC seized $3000 worth of illegal CB radio equipment from the residences of John Robinson, Andrew and Mary Lou Calloway, and Ted Green.

The seized equipment included two non-type accepted transmitters capable of operating on frequencies not authorized for use in the Citizens Radio Service. Also seized were six CB linear amplifiers.

FCC Engineers from the San Francisco Office investigated and identified the locations of the three operators after receiving many complaints of interference to TV and radio reception from their neighbors. Robinson, Calloway and Green repeatedly refused to permit FCC personnel to inspect their CB radio stations. FCC Rules (47 CFR 95.426) require that all CB radio stations be made available for inspection upon request of an authorized FCC official.

In total, $3200 in fines were issued to Robinson, Calloway and Green.

WASHINGTON UPDATE, September 26, 1989

NEW REGIME SET TO SAIL
THROUGH FIRST MEETING

Contact: Gordon Maxson

STATUS: A slim agenda, with no common carrier items, is planned for the first public meeting of the "new" FCC on Sept. 29; three of the four commissioners, including the chairman, have been sworn in since the last meeting in August.

The schedule includes discussion of the following topics:
- A radio frequency for stolen vehicle recovery systems;
- Maritime and aeronautical mobile service regulations;
- Policies regarding licensees involved in drug trafficking;
- Improvement in AM radio broadcasting.

TECHNOLOGY
VS. PRIVACY

COMMENTS: "The politics of privacy is a potential powder keg," warned one speaker at the U.S. Telephone Association's public relations seminar here recently.

The director of the Computer Professionals for Social Responsibility, Marc Rotenberg, made the statement during a sobering discussion of the controversy surrounding privacy rights of customers using the caller identification service, now being introduced by various telephone companies.

His message was clear: If the appropriate safeguards are not put in place, the industry will soon be seen as Ma Bell becoming Big Brother.

Rotenberg was referring to the phone companies' ability to collect and exchange transactional information. He advised the industry to avoid collecting this information or the credibility of the phone company will be destroyed.

Larry Kaagan of the Daniel Yankelovich Group said that the implementation of open network architecture may hasten the privacy debate. He pointed to a growing concern of decision makers as they understand ONA and see the potential lack of accountability of the telephone company for the network when ONA is in place.

A representative of BellAtlantic presented the industry position that caller id services enhance the privacy of the person being called and he cited safety statistics to support its implementation.

In closing, Rotenberg asked the industry to consider the chilling effect on its business if these privacy issues are not resolved to the customers' satisfaction and the result is less use of the network. "You should not assume that because something can be done that it should be done," Rotenberg said.

==========

"THE DXPEDITION FOUNDATION"

The DXpedition Foundation has been formed as a legal 502c3 tax exempt organization to foster the development of amateur radio operations and knowledge throughout the world. By encouraging and sponsoring DXpeditions to lesser developed countries, The DXpedition Foundation hopes to increase amateur radio activity in countries with small ham populations. While not all of these countries may be considered "rare" to DXers, the level of amateur activity and representation is low enough for the threat of loss of spectrum allocation to be real.

The DXpedition Foundation will support DXpeditions to relevant countries using funds raised from tax-deductible donations of equipment and money. The DXpedition Foundation is headed by Jim Talens N3JT, Fred Laun K3ZO, and Bob Sullivan W0YVA. If you are interested in going on a DXpedition, including active efforts to train local people in amateur radio, or if you would like to make a donation of equipment or funds, contact N3JT at his callbook address. Or, if you are a die hard EMAIL type, you can forward messages to me and I will pass them along to N3JT.

>though the intent is to use them only in an emergency, the FCC says
>ELTs are for aviation use only. I wonder if being a ham would make
>any difference here...

The subject of portable ELTs being used by backpackers was brought up
at a recent Mt. Wachusett Civil Air Patrol meeting. The consensus was
that while the current percentage of VALID ELT signals is about 6%,
it would probably drop to about 2% with the advent of portable ELTs.

How many Boy Scouts out there are going to have moms who insist they
take along the ELT "for safety sake"? Of COURSE, the Boy Scout is just
gonna HAVE to try it out to make sure it works, right? And no, I'm not
picking on Boy Scouts; I have a son who is a Boy Scout and that is
just what I'd expect him to do....Some of the new owners of ELTs may
just not be responsible enough to understand the implications of having
a "new toy".

Oh, well, CAP members, be prepared! (Isn't that the Boy Scout motto :-)

Not meaning to be picky or anything but:
I have seen this concept mentioned to many times to count and I even remember in my youth unwinding the wire of of electric motors to build antennae. This may have been alright 20 years ago but it is not only considered unsafe now but is in most instances illegal. The National Electrical Code (NEC) specifies a minimum size for wire used for both receiving and transmitting antennae and it is not small!!! If I remember correctly it is either 12 or 14 gauge minimum. And the part that makes it illegal is the fact that the NEC has been adopted in the ordinances of most municiplaities in the country. I would guess if the town is big enough to have an apartment building it probably has the NEC in it's building codes.
It is hard enough getting along with non-ham neighbors but when your station is not constructed using good engineering practices you won't have a leg to stand on when the neighbors start to complain.
If there is any doubt about what you can and can't get away with, I would recommend a trip to the local Municipal Building for a look at the building code. And maybe it's time we all read the applicable portions of the NEC.

Source record: 16641

I saw a message lately that suggested the renaming of rec.ham-radio
to rec.radio.ham in order to allow .swl and .vhf etc. under rec.radio.
Personnaly I am in favor of swl's having their own group(s) but I don't
see where there is any need to muck about with rec.ham-radio in order
to do it.
REMEMBER: If it ain't broke, don't fix it.

>know how to treat them right, but they can bite if you don't.

Bob's point is a very good one, though I get more than 2 mW/cm^2 for
the conditions he suggests. The danger is not from large dishes (which
look like "death rays"), but from small radiators of high power.
Contrary to popular belief, the bigger the dish the safer it is since
the transmitter's power is spread over a larger aperture (area). The
dangerous point is the feed of a low F/D dish which is likely to be
little more than an open end of waveguide. All of the transmitters
power has to pass through that area and the flux density can be high.
However it is diverging pretty rapidly and generally is not a very
physically accessible point anyway.

This same argument applies to more conventional amateur transmitters
and antennas. One danger from high RF is to the retina of the eye, but
I think in most situations the greater danger is probably to the cornea
since you probably have to poke yourself in the eye with a 1296 antenna
in order to get close enough to have a problem. A second danger, which may
be the primary one, is to the stomach from excess acid due to *thinking*
you are being "dangerously irradiated". I had a complaint one time from
(an engineer!) who was concerned about "the dangerous levels that a
'safe' amount of power could be focussed to by a small dish at microwave
frequencies" one time. This was from a 10 mW 10 GHz doppler radar module
of the type that hangs over the front of supermarket doors.

I don't mean to imply that we should be cavalier about RF exposure but
many people certainly seem to have misconceptions about where the dangers
lie! Maybe some group will discover this and boycott automatic door openers,
that would be interesting.

>electronics stores in Tokyo in Akihabara and Shinjuku areas.
>But, where are the ham radio stores? Can anyone provide names or
>addresses (and subway stops)? I'm not planning to buy anything,
>but I do want to look!

I don't have any names, but they are all there in Akihabara. Let me tell you what a friend of mine told be about a month ago when he went to Japan. There is a place (sorry I don't know the name/address) in Akihabara that is 3 floors full of ham equipment. The first floor is all HF, wall to wall. The second floor is mobile gear, wall to wall. The third floor is microwave and antenna equipment, wall to wall. Because things tend to be a bit crowded in Japan, I don't doubt his description.

You'll even find places selling multi-ganged/open air variable capacitors. Places that *JUST* carry coils only. Or *JUST* tubes. The parts business out there is really competitive so you'll find dealers specializing in only one thing. And whatever it is, they know it quite well.

If anything, a least buy some sort of rare part. The prices for rigs and test equipment are too high.

2931. SWL--A lurker speaks up

Newsgroup: rec.ham-radio
Date: 1989-09-27 14:20:04 UTC
From: rajiv@ee.rochester.edu
Message-ID: <1989Sep27.142004.7787@ee.rochester.edu>
Source record: 16651

First of all, let me say that I think a group on SWL'ing, whatever it's name, is a GREAT idea. I did not even know there were shortwave related articles in rec.ham-radio until I just happend to browse through it. I'm sure there must be other such enthusiasts. This seems like a friendly group, but I'd prefer not to have to wade through all the ham-related stuff for what I'm interested in.

As far as names, rec.swl seems a little obscure unless you know what "swl" means. The rec.radio.* notation seems perfect, and rec.radio.monitoring is very appropriate.

I think we need more postings on SWL on this group to demonstrate that a need for a separate group exists. I'll put my keyboard where my mouth is and post a couple of articles following this one.

2933. SWL--Calling Sangean owners

Newsgroup: rec.ham-radio
Date: 1989-09-27 14:21:59 UTC
From: rajiv@ee.rochester.edu
Message-ID: <1989Sep27.142159.7872@ee.rochester.edu>
Source record: 16653

My wife recently bought me a Sangean ATS-803A for my birthday (leaving those open EEB catalogs around the house with items circled really works! :-)), and I'd like to exchange notes with other owners.

One of the problems I've been having is that every so often, I get this horrible motorboat-engine sound for a few seconds which then disappears. First I thought it was electrical interference from car ignitions, but I wonder if it's oscillations within the set. Anyone else experienced this? Jumping to other frequencies doesn't help, but it disappears in FM mode. However, going from AM to FM and back to AM doesn't usually cure the problem--it seems to start and stop at random instants.

I'm not sure this is not external interference of some kind, but I'd be concerned if this was intrinsic to the set. Otherwise I'm extremely pleased with the set's performance--it really is a great buy.

2934. SWL--Active Indoor Antennas?

Newsgroup: rec.ham-radio
Date: 1989-09-27 14:23:06 UTC
From: rajiv@ee.rochester.edu
Message-ID: <1989Sep27.142306.7956@ee.rochester.edu>
Source record: 16652

Hi,

I was wondering what kind of antenna solutions exist for us apartment dwellers. I have a Sangean ATS-803A and I've been using the whip antenna for my swl'ing. Of course I'd like to install a trapped antenna outdoors and get amazing reception, but I can't.

I was wondering about people's experience with indoor active antennas. I've played around with a 40-ft length of stranded wire strung around the room and that does better than the whip, but are there other solutions?

I know overloading the antenna input could be a problem; I expect to use the RF gain control of the Sangean a lot. If you've had good results with a particular indoor antenna, I'd be very interested to hear about it.

>any difference here...

>Phil

Hmm ... I wonder if there are any rules about the simple possession
of aircraft-band radios, and not just about transmitting from them.

I thought about not being acknowledged if something WERE to happen
and I were to 'call' the police directly. As a ham, I was taught
not to acknowledge any signals on the ham bands that did not have
a proper ID attatched to them.

Still, it's too bad it has to be this way, even if only because the
delay between 911 and the police radio is, in my experiences while
listening to my HT after calling 911, several minutes. Those minutes
could be very precious.

price@MARLIN.NOSC.MIL (James N. Price) asks:

>I've heard about the amazing concentration of
>electronics stores in Tokyo in Akihabara and Shinjuku areas.
>Can anyone provide names or addresses (and subway stops)?

The two major areas in Japan where ham stores are gathered around are Akihabara in Tokyo and Nihonbashi in Osaka. There aren't ham stores in Shinjuku - that's where the camera stores are (such as Yodobashi camera, Doi camera, and Sakuraya). Unless you're into cameras or watches, no need to visit Shinjuku.

The major ham store in Akihabara is "Rocket Honten" (Rocket Main Store). Rocket has several branch stores in the Akihabara district. The one devoted completely to amateur radio is the Main Store, which is located at Shouheibashi (Shouhei Bridge). This is at the west end of Akihabara.

There are a couple of ways to get there. Convenience depends on where you're coming from, and how quickly you want to arrive.

Perhaps in your case, you might want to look at the Akihabara district itself on your way to the store. In that case, JR Akihabara station is for you. (JR is the new name for the now divided Japan National Railways.) Akihabara station is on the Soubu Line (the yellow trains). The exit to Akihabara is marked "denkigai" (electronics mall), and is on the lower level of the station. Go down all the stairs until you come to the station exit. You will find yourself in the east section of Akihabara. There is a well-known saying, "The closer to the station, the steeper the prices", so you just want to window shop around here. Go out to the main street (Japanese streets usually don't have names - houses and buildings are known by their block number rather than their street they're on), turn left, turn right at the first major intersection (Manseibashi - Mansei Bridge - there's a nice Museum of Transportation here if you're interested) and go west. Shouheibashi is the next major intersection, and Rocket Honten is on the corner. Not to be confused with Rocket Shouheibashi (Rocket Shouheibashi Branch) which is right next to it. You want the store that has a whole array of HTs on the first floor, not the one with electric fans and air conditioners.

If you are more, uh, maniac, then you can get to this store quickly from Ochanomizu station. (I say maniac because many people don't realize that Ochanomizu is so close to Akihabara. The only people who seem to know are those who went to school in the area, like myself, or those who are into electronics.) JR Ochanomizu is on both Chuo and

Sobu Lines. Chuo Line cars are painted deep orange; Sobu Line cars are painted yellow. The subways stations are Ochanomizu on the Marunouchi Line (the Tokyo metropolitan subway system icon for this is a red circle) and Shin-Ochanomizu on the Chiyoda Line (iconized by a green circle). From JR Ochanomizu, get off at the east exit (towards Akihabara, the next eastwardly station on the Sobu Line), and walk down the street along the tracks - I mean literally down, as the street slopes downward toward Shouheibashi. At the bottom of the hill, which is the Shouheibashi intersection (you can see the Kanda Firehouse on your right), turn left and cross Shouheibashi (the bridge itself). Rocket Honten is on the corner.

Same directions apply if you are coming from Shin-Ochanomizu; come out of the stairway closes to JR Ochanomizu, which exits right in front of JR Ochanomizu east exit, and do the same as above.

If you are coming from Ochanomizu (Marunouchi Line), which is on the other side of the Imperial Moat (which is why we need so many bridges around here), exit, go down the street all the way, and you will reach Rocket Honten at the bottom of the hill.

Rocket's founder, who, I believe, is still president, is as ham. I don't know his call, but I do know he started out his stores by selling ham radio stuff as well as household appliances. Rocket is not necessarily cheaper than the Nihonbashi district in Osaka, but they do offer safe prices as compared to other stores in the Akihabara district. By "safe" I mean "one of the more competitive". Price differences in Akihabara are not as marked as in Nihonbashi - it appears that you need inside contacts for a good sale in Osaka, which is not true in Tokyo, so for regular customers like you, Rocket is a good place. Besides, the four-story building is packed with amateur radio stuff. This is by far the one place you want to visit if you want to look at equipment. They have a listening booth, too, which may not be so impressive out here in the U.S. where you have lots of real estate to spare, but in downtown Tokyo where space is money, setting aside a corner for customer use is an expensive sacrifice.

As for other stores in Akihabara, well, I'm afraid I'm too tired to type about. And as for Nihonbashi, let me know if you're interested in going there, and if you are, I will respond. Anyway, for the moment, safely assume that if looking at ham radio gadgets is what you want to do, Rocket Honten *is* the place.

In some places, Police Frequencies are shared by adjacent cities. However, the police in each city do not hear the police in the other city because their radios have a sub-audible tone to identify the city. Thus, where I live I can hear both Allen and The Colony. We had a jerk recently broadcast profanity on the police frequency one night, but the police did not hear him (verified by checking the recordings) because his radio didn't also broadcast the identifying tone. Of course, his signal could have interfered with an officer if he had broadcast at the same time...

> > I thought was a couple of very interesting sections.

Let's not go off the deep end on this. The new portions of 97 that deal with anything goes when lives are at stake are not a new attitude at the FCC. That provision has ALWAYS been contained in the Communications Act of 1934. The only thing new is that explicit wording to that effect has been included in Part 97 as well since very few hams keep a copy of the CommAct lying around.

I once asked the supervisor at an FCC monitoring station what the Commission's yardstick for this sort of thing was in the case of the unlicensed use of ham radio by boaters. His answer was, "They darn well better be sinking or on fire!" With the FOP and various associations of police chiefs on their back, I hardly think they would be less strict in the case of hams in the police bands.

There is a vast difference legally between using whatever is at hand in a life threatening disaster and preparing in advance for such use. My view is that if a bunch of hams make the boneheaded blunder of making Public Safety Band mods on their radios and grabbing the first excuse they find to "play cop", the very least punitive response of the FCC would be to require type-acceptance of ham gear and TA standards that would require designs that can't be modified without permanently disabling the radio. It would be quicker, easier, and cheaper to simply take away all of our VHF/UHF bands that are anywhere near public safety frequencies. Guess which course they'd pick?

There has been a lot of commentary in recent months about the need to raise the level of ham PR activities in hopes of saving ham radio from being dismantled one band at a time. I cannot think of ANYTHING more counterproductive to that goal than a bunch of hams on police frequencies reporting that the stopsign at Maplewood and Phillips is crooked. (And we all know there'd be boneheads who'd do just that for the 'kick' of talking to "Dispatch".)

>though the intent is to use them only in an emergency, the FCC says
>ELTs are for aviation use only. I wonder if being a ham would make
>any difference here...

I doubt it. ELT's transmit on 121.5 and 243 MHZ, 243 MHZ being the military guard (read "emergency") channel. I have read several places about not only the FCC going after these backpackers but also the FAA.

The scenario is fairly simple. An ELT is activated by a hard jolt (several G-forces), like when an airplane crashes. Several US and USSR satallites monitor these freqs. After doing some DFing on the signal, if it is determined not to be at an airport, the SAR effort swings into effort. This involves civil authorities, Civil Air Patrol, and sometimes the military.

Granted, backpackers could benefit from something similiar to an ELT, but let's not confues the aviation community with more and more people carrying ELTs. We have enough to worry about with Congress and the DEA wanting to shoot our behinds out of the sky.

Not only is it a violation of the FCC regs to use an ELT for non-aviation uses, I also believe that it is a violation of the FARs (Federal Aviation Regulations) to even REMOVE an ELT from an airplane except for maintenance, and then a qualified avionics technician must do it. I don't have a copy of the FARs here at work, but believe that it is the case.

I am not a HAM but a pilot (my boss is the HAM).

*tank!eecae!cps3xx!usenet@handies.ucar.edu (Kenneth J. Hendrickson) replies:

*You should be ashamed of yourself Jeff. You may never cause
*interference deliberately! Let me repeat it again:

*CAUSING DELIBERATE INTERFERENCE IS _ALWAYS_ FORBIDDEN! EVEN IN AN
*EMERGENCY! THOU SHALT NOT CAUSE INTERFERENCE TO ANY STATION
*(IN ANY SERVICE) INTENTIONALLY!

*You should know this Jeff. This was on the novice exam. You are at
*least a technician (I assume; I couldn't find you on the callsign
*server). Please, DON'T EVER PURPOSELY CAUSE INTERFERENCE, and don't
*tell others that it's ok to do so. It has always been illegal, and
*I expect it always will be.

Have you ever listened on a 2 meter repeater when two people are in a
rapid fire QSO? It's hard to get even one word like "break" in without
transmitting on top of them.

So here I am, on an accident scene. I am looking at a women that is laying
there dead. Her baby is bleeding like a stuck pig, another passenger has
half his guts hanging out. Well what to do? I get some of the bleeding
stopped and watch a bunch of motorists slowly driving by "gawking" at all
the blood and gore. Grabbing my handheld I turn it on with the intention
of calling for aid. I can actually see the repeater tower less than 1/2
mile away, but upon turning it on all I hear is Joe and Tom talking about
their latest operations. Hmmm, well I don't want to cause intentional
interference so I wait for an opening. Of course it IS pretty hard to
hear one since that damn women is screaming too loud right next to me.
I don't want to use a police frequency because I might piss off the
police dispatcher, and geez... if I am in New York I would be charged
with a misdemeanor for even HAVING the radio in the car that CAN talk
on that freq. So what should I do? I am thinking that maybe I should
get back in the car and leave... Joe and Tom have yet to take a breath
in their QSO... I COULD transmit over top of them and even if I couldn't

capture the repeater receiver maybe at least they would notice the "interference", but no I am an EXTRA class ham and KNOW that is illegal!

GET THE POINT?!?! Look here is my opinion. The hell with ham radio and to blazes with the law. I will try to save the life and if I break the law in the process TOO BAD! I will also suffer any consequences and will do so very gladly and to tell the truth PROUDLY. But then I always was a "radical" son of a gun.

Sorry folks... I just got tired "again" of hearing the law says this, the law says that, and now we are talking about just HOW it is LEGAL to go about saving someone's life.

Which is more important to you... your amateur radio license or someone's life?

Well, it's been six years since I was there, but I doubt if anything has changed. In Akihabara are not only the general consumer electronics dealers (stereos, walkman clones, tv's, air conditioners, etc.), but also many of the commercial component distributors and, most important, THE HAM STORES. The only name I remember was ROCKET. They actually are a chain throughout Japan, but have a very nice outlet in the Akihabara. I crawled around all of the stores in the section, and bought a lot of stuff- my QSL is up on the wall of at least one of them! Remember, though, the buys today are not going to be as good as they were six years ago- I think the exchange today is around 130 Yen/ Dollar, and it was twice that (260/$) when I was there. Whoops, I forgot- you said you weren't going to buy anything :^)- I wasn't either, but the stuff they have is SO NEAT...

Bottom line- look for the ROCKET stores, or any buildings that have ham antennas on top- many do, and that's how I found most of the dealers. Also, DO BUY a copy of Japanese CQ, if for no other reason than to drool at all the equipment the big three sell over there that never make it here.

Hope this helps. 73 Dave Hallidy KD5RO

p.s. When you get back, let me know if my card is still up on the wall- as of about two years ago it was.

2944. rec.swl --> rec.radio.shortwave

Newsgroup: rec.ham-radio
Date: 1989-09-27 20:43:11 UTC
From: rshapiro@bbn.com
Message-ID: <46179@bbn.COM>
Source record: 16660
Cross-posted to: news.groups,rec.ham-radio

Since I've gone almost a whole day without getting any more group-name votes, and since I already have votes from 36 people, and since the pattern has stayed fairly consistent, I think I'll declare the polls closed.

Results:

Positive votes:
rec.radio.swl 235
rec.radio.shortwave 201
rec.radio.dx 184
rec.swl 168
rec.shortwave 166
rec.radio.monitor 160
rec.broadcast.dx 130
rec.broadcast.monitor 92
rec.shortwave-radio 91
rec.radio-tv.dx 88
rec.radio-tv.monitor 82
rec.ham-radio.swl 76

'O' votes (i.e. won't vote for the group if it has this name):
rec.ham-radio.swl 15
rec.radio-tv.monitor 13
rec.radio-tv.dx 10
rec.broadcast.monitor 10
rec.swl 10
rec.broadcast.dx 7
rec.shortwave-radio 7
rec.shortwave 5
rec.radio.dx 5
rec.radio.swl 4
rec.radio.shortwave 3
rec.radio.monitor 3

My conclusion? Despite the apparent win for rec.radio.swl, I think I'll go with the second place rec.radio.shortwave. Fewer keystrokes would be nice, but gathering a larger audience (as I think the longer name will) seems more important. So, for this proposal at least, the name is now rec.radio.shortwave. If it fails (a snowball's chance in hell, I know :-), someone else can try again with a different name.

I'm not really crazy about this choice, I must admit. Will the scanning folks and the tv dx'ers realize that this group is for them too? I don't know. But the poll convinced me that most people would

like to see a rec.radio.x hierarchy (average vote for the rec.radio names was 195; average vote for rec.broadcast names was 111; for rec.radio-tv 85; overall average 139.4), so I'll go with that (but avoid the possibly cryptic "rec.radio.swl").

I'll re-post the original 'call for discussion' article, with the new and improved name and see what happens.

Thanks to all who voted. I hope the three of you who voted '0' for rec.radio.shortwave will reconsider...

With all of the talk about not carrying ELTs backpacking, are you objecting because they are set off by a jolt as opposed to a switch. If this is the case then maybe they should carry EPIRBs. This is the marine equivilent of the ELT but is set off by a switch which must be thrown.

If there is some other objection, then I don't understand. Is the life of a pilot or a sailor more important than the life of a backpacker or is there another problem.

Those minutes occur because dispatchers prioritize calls, and dispatch to available units in priority order. REAL emergencies (defined as situations where the dispatcher, not the caller, thinks lives are at stake) can hit the air in 30 seconds or less... while you are still talking on the phone and giving more details -- something you couldn't do on the radio.

Time sense is very distorted in an urgency situation. While a fire commissioner, I fielded complaints from people who claimed the FD took OVER 15 minutes to get to the fire at their house. Actual clock time was 3:30.

This REALLY bothers me. You can't even buy a new 2m radio anymore
that doesn't receive out of the amateur 2m band any more. What if you
live in Small Town, NY where the police are on 15X MHz? You are an
instant criminal. This law needs to get changed immediately. I am
almost thinking of writing to the NY legislature and several large
cities' Chamber of Commerce, telling them that I won't be vacationing in
New York until they change this silly law. I would also tell them that
I am informing all of my friends throughout the midwest of NY's anti-ham
laws.

Lets stop changing law-abiding citizens into criminals because some
groups have powerful lobbying efforts! Soon, ham radio won't exist
because the only radios the public will be allowed to own will be simple
2 band broadcast receivers; multi-band assult radios will be outlawed!

- ARRL LETTER - Volume 8 Number 19 - September 22, 1989 - Part 4 of 4
-
- FCC ENFORCEMENT ACTIONS
-
-In conjunction with the San Francisco FCC Field Office, the US Attorney's
-Office in Fresno, CA, has initiated a second criminal prosecution against
-Donnie Ray Johnson, doing business as Red Monkey Communications in Fresno,
-CA for the marketing of illegal Citizens Band (CB) radio equipment. On
-August 14, 1989 engineers from the FCC San Francisco Office, along with US
-Marshals, conducted a search and seized $2000 worth of illegal CB linear
-amplifiers.
-
-In 1985, Mr. Johnson was convicted for the same offense and was fined $5000
-and placed on 2 years probation.
-
-Johnson's prosecution is part of a continuing enforcement program to assure
-that the FCC ban on manuafacturng and selling CB linear amplifiers and
-other non-type accepted transmitters is observed. Federal law (47 USC 302
-(b)) prohibits the marketing and manufacture of such non-compliant
-electronic equipment. A second conviction for violation of this law carries
-a maximum fine of $100,000 and/or two years imprisonment.

Is it possible that this is the same Don R. Johnson who recently posted

Last night, a ham friend and I were talking in a lounge area on the WPI campus when a student we didn't recognize walked in carrying a Kenwood TR2500 2 meter handheld. When we asked him about it, he simply stated that it was a "transceiver." He didn't seem to know what ham radio was, and was surprised when we told him that he needed a license to operate his transceiver. He was using it to talk to a friend in one of the dorms (also a non-ham) on 145.6 MHz. The student said that the radios belonged to his father, who uses them at White Sands in conjunction with some sort of testing that he does there. He added that the radios operate from 140 to 150 MHz, so it is probable that transmissions related to whatever "testing" his father does at White Sands occur on military frequencies outside of the 2 meter band.

I am wondering whether it is common practice for civilian personnel working on military bases to use ordinary ham gear out of band for their communications. This is the first time I've ever heard of such a thing, and it sounded somewhat odd to me. Can anyone offer any more insight in this matter?

Greg
N1DEM

p.s. I've seen Kenwood ham transceivers advertised in magazines such as "Soldier of Fortune" at greatly inflated prices and with no mention of ham licenses being required. I don't mean to re-kindle the "selling ham gear to unlicensed people" debate, but I'm concerned that we could start seeing much more ham gear winding up in unsuspecting, unlicensed hands.

> indicative of declaration's success.

But, your case and the case mentioned in another article are
different. When you "accidentally" dialed up the band, you were
politely asked to go to another frequency. You apologized, and then
went to another frequency. I wouldn't think you would get
prosecuted.

However, when the "radio slug" on 3912 KHz (I think, don't correct
or flame), was asked to move, he was a> Rude, b> Inconsiderate (He
cranked up the power, and refused to go to another frequency), and
c> endangered necessary rescue efforts. THOSE are the type of
people who I wish will get caught for their indiscretion.

The New York law which I quoted above is NOT, I repeat NOT anti-ham!
If anything, it goes to great pains to bring up the point that amateur radio
apparatus is not to be confused with what is being outlawed - receivers
INTENDED to receive police frequencies.

I will be the first to state that the legal system in the United
States is far from perfect; however, until we come up with something better,
we're going to have to live with it. One of the imperfect aspsects of our
legal system is that we have certain "possession" laws to assure that a
perpetrator of a crime gets charged with _something_, if for some reason,
there is insufficient evidence to charge such a perpetrator with the "real"
crime. Examples of these "possession laws" are: "possesion of a deadly
weapon", "possession of burglar's tools", "possession of eavesdropping
devices", etc.

The Vehicle & Traffic Law section cited above is an example of such
a "possession" law. By its very nature, a "possesion" law must be broadly
worded. On the other hand, there is a wide degree of discretion in the
enforcement and prosecution of such "possession" laws.

The prohibition against possession of receivers in a vehicle capable
of monitoring police frequencies is primarily intended to prosecute persons
committing burglaries and robberies, and to a lesser extent to deter
"ambulance chasers" and, for lack of a better term, certain "nuts" who
would ride around and respond to police calls.

The issuance of an amateur radio license is no guarantee that the person so licensed is going to be a sane, law-abiding citizen, and certainly should convey no "right" beyond that of a private citizen to have a police receiver in a vehicle.

From a practical standpoint, it is improbable that this law would be enforced in and of itself unless the amateur radio operator driving the vehicle did something ELSE which was either stupid or unlawful. Also, from a practical standpoint, it is improbable that any police officer will recognize the out-of-band receive capability of any amateur transceiver. Now, a police officer WILL recognize a scanner, however. But then again, we all realize that with the advent of multi-channel synthesized, scanning amateur transceivers, there is hardly much utility in having a scanner tuned to amateur frequencies.

If we want to be candid, for all intents and purposes, an amateur radio operator having a scanner in his vehicle is NOT going to be using said scanner for amateur radio purposes. Under these circumstances, why should an amateur radio operator have a privilege not afforded to other citizens?

2953. Technical help for a blind ham

Newsgroup: rec.ham-radio
Date: 1989-09-28 05:24:31 UTC
From: jgd@rsiatl.UUCP
Message-ID: <148@rsiatl.UUCP>
Source record: 16577

I am posting this for a blind ham friend here in Atlanta. This person has a Kenwood 721 radio. I'm not familiar with this radio but apparently the frequency is entered via a rotary dial. What my friend wants to be able to do is enter operating parameters, principly frequency, from a keypad. He is aware that this is possible of he buys the kenwood handset. He has no use for the handset and desires to continue using a hand mike.

So the question is. Do any of you know if there is a keypad available for this radio? Either kenwood or aftermarket is OK. If no device is available, is the interface protocol between the radio and accessory handset documented? I could whip him up a little single chip controller solution if the protocol is documented. Anybody have a service manual or other relevant information?

Any help would be appreciated. Please Email if possible.

Thanks,
John

> > (one and only) frequency 460.375. The radio looks like it is years old
> > well as the 70 cm ham band. Please note: (for all ready to send me hate
> > mail) he has proof that he is licensed for both the 70cm band, as well
> > as, the State Police 460Mhz frequency.
>
>But no radios are authorized for both.... Type acceptance and all that.

Geez, why do we repeat this cycle every 3 months. ANY radio that meets the rather minimal emissions standard can be used on the ham bands. Commmercial, ham, or homemade. Can we please kill that rumor once and for all? (Naaaaa. That'd cut usenet traffic down to below 20 mb per day).

Secondly, why does everyone think it is necessary to spout the same type-acceptance gorp robot-like anytime the words "commercial" and "ham" are seen together. I'm sure that everybody on this net, everybody's spouses, and everybody's pets know that ham equipment is not type-accepted. My question is, why don't you spend the keyboard effort HELPING the guy? Sheez!!

Now, daryl, to your question. What your friend needs to do is purchase the commercial version of the popular ham HT's. Kenwood, Icom, and Yaseau all make "type-accepted" versions of current production HT's. The only difference I've seen is the little type-acceptance sticker - and the price. In any event, these rigs will happily operate on ham frequencies. The 2-way shop will likely optimize the performance for the commercial frequency as applicable which is proper. After all, his department communications are more likely to involve immediate threat hazards than in the ham bands.

I have a friend that has one of the commercial Yaseau rigs. It is in almost all respects identical to the ham version. The MPU programming is a bit different - after all, few commercial users need programmable frequency capability - but the hardware is the same.

One caution - The FCC is moving (or has already moved?) to ban user-programmable radios in the commercial services. So if your friend wants to get a type-accepted radio he can program, he better move fast.

73 john

2955. Assn. of Shortwave Broadcasters Formed

Newsgroup: rec.ham-radio
Date: 1989-09-28 07:01:55 UTC
From: rh@well.UUCP
Message-ID: <13854@well.UUCP>
Source record: 16582

Representatives from 13 of the 17 FCC-licensed International Broadcast Stations met in New Orleans on September 13 to form a new broadcasting organization.

Tentatively called the ASSOCIATION OF SHORTWAVE BROADCASTERS, Edward J. Bailey representing KNLS was appointed President; W.E. "Ted" Haney from Far East Broadcasting Co. stations KGEI and KFBS is Vice-President, and Tulio Haylock representing KSDA is Secretary. Larry Blosser of Fisher, Wayland, Cooper and Leader is legal consultant and George Jacobs & Associates, Inc. is technical and regulatory consultant. The stations represented at the charter meeting were WCSN, WSHB, WWCR, WRNO, WMLK, WHRI, KUSW, KVOH, KGEI, KNLS, KFBS, KHBI and KSDA.

The main purpose for the organization (the 1st ever created for US shortwave broadcasters), is to make the FCC more aware of the specialized needs of FCC-licensed SWBC stations, and more responsive in meeting these needs than they have been in the past. The organization also plans to act as a focal point for private sector participation in national planning for ITU conferences dealing with shortwave broadcasting.

Planning has also begun to set into motion the updating and redrafting of Part 73, Subpart F of the FCC Rules & Regulations, which governs International Broadcast Stations. A meeting to brief the newly appointed FCC Commissioner Alfred Sikes is planned for the near future.

Membership in the Assn. of SW Broadcasters is open to all FCC-licensed SWBC stations. Associate membership will be available to interested consultants, attorneys and equipment manufacturers. Additional information concerning this new organization can be obtained from Edward J. Bailey, KNLS, P.O. Box 1468, Franklin, TN 37067 (telephone 615-371-8707).

The RSGB National HF Convention takes place next Sunday, the 1st of October. This is a one-day convention with a comprehensive programme of lectures, and in a special ceremony at 3.30pm the DTI will announce the name of the 1989 Young Amateur of the Year. The Society will announce the names of the runners-up, and the prizes will be presented in the presence of a number of distinguished guests. Several RSGB committees will have stands, and it is hoped that a member of the Planning Panel will also be present.

The Chairman of the Society's EMC Committee will be announcing the new EMC Co-ordinator's scheme at the Convention. The intention of this scheme is to provide local contact points for general EMC advice, initially by telephone or post. There will be more information in a subsequent edition of Radio Communication.

The venue for the HF Convention is the Belfry Hotel at Milton Common, near Oxford. The doors open at 9.30am, and light lunches and snacks will be available. Dinner, bed and breakfast is available on the Saturday evening before the Convention at a cost of 23 per person; telephone Great Milton 381 to make a reservation. More information on the Convention was given on page 27 of the September edition of Radio Communication, which also showed a map of how to get there.

Last week Hurricane Hugo caused widespread damage in the Caribbean, and amateur radio is continuing to provide links into the disaster area; a considerable amount of health and welfare traffic has been passed on the 20 metre band. Until this traffic ceases, all amateurs are requested to keep the frequency 14.275MHz plus or minus 5kHz clear. Amateur radio is currently one of the very few ways in which communication with the disaster area is being maintained, and it is most important that this frequency is kept as free from interference as possible.

The Harlow Rally takes place today, at the Harlow Sports Centre. This year the doors open (opened) at 10.30am - not 10am, as in previous years - and the event ends at 5pm. There is ample free parking, and talk-in will be available on S22 via G6UT. As well as the usual rally

attractions, there will be a very large bring-and-buy section. More information is available from G4MIS on 0279 722622.

The Blackwood Amateur Radio Rally takes place next Sunday, the 1st of October, at Oakdale Community College. Doors open at 10.30am and all the usual rally attractions will be available. Car parking is free, and there's also a free raffle. More information is available from GW0JWF on 0495 243858.

RTTY operators in various parts of the country are experiencing interference from phone contacts on 145.3MHz, which in the bandplan is allocated to AFSK teletype. 144MHz phone operators are asked to bear the provisions of the bandplan in mind and to avoid channel S12. A current 144MHz bandplan appears on page 2 of the 1989 edition of the Call Book.

Cray Valley Radio Society will be operating a special-event station from Littlebrook D power station on the south bank of the River Thames next Saturday and Sunday, the 30th of September and the 1st of October. The power station is situated next to the Dartford Tunnel and is open to the public between 2pm and 6pm on the Saturday and 11am and 5.30pm on the Sunday. The open days are commemorating 50 years of power generation from the Littlebrook site, and the special-event station will be using the callsign GB4LBD.

The Solent Fortifications Amateur Radio Group will be operating from the Square Tower in Portsmouth on 7MHz SSB next Saturday, the 30th. The callsign to listen for is GB0CDQ. More information is available from G0JRN.

The Lewes UHF repeater GB3LR is back on the air again after an overhaul, reports will be welcomed by its keeper, G0FHR also, GB3OS - the Stourbridge UHF repeater - is temporarily off the air following loss of permission to use its site. It will be operational again when the DTI has approved the new site.

The Post Office has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0MH and G7FT series.

Message-ID: <7325@GB7HQQ>
From: GB7HQQ@GB7HQQ
To: NEWS@GBR
Subject: GB2RS 24 Sep (2/10): SOLAR NEWS
Path: GB7NWP!GB7CDM!GB7DQW!GB7SUT!GB7LRG!GB7SPV!GB7HHH!GB7HQQ

From: GB7HQQ@GB7HQQ

There was a general decline in solar activity during the period between the 11th and the 15th of September; this was expected, since the quiet side of the sun was facing the Earth. There was a small proton flare up to M 5.3 on the 12th and a ten flare up to 570 units, but almost nothing else. The spot count was around the 280s and solar

flux levels averaged 261 units.

The geomagnetic A index was quiet until the 15th, after which it reached a sub-storm level of 20 units; the average for the period was 10 units. The radio quality indices were above normal for most of the period. It's understood that there was a good 144MHz auroral opening late in the evening of Monday the 18th, but almost no reports had been received when this broadcast was prepared; we expect to have more information next week. G8XVJ worked several Polish stations on SSB and said that the aurora was still present at 0720 on the following morning.

And now the ionospheric data for England and Wales. There was an increase in the F2 daytime critical frequencies at Slough as reported by Appleton; this is partly due to the seasonal changes which are now beginning to take effect. Levels increased until the 15th, when 12.1MHz was recorded, but the 16th only reached 6.7MHz - possibly because of a magnetic disturbance and some aurora. However, levels quickly improved and were back to 10.5MHz by the 17th. The darkness hour lows hardly changed and averaged 4.8MHz. Other phenomena was recorded every day and lasted up to 10 hours on some days. The 15th and 16th were affected during darkness hours by spread F lasting up to 6 hours, of which two hours were total.

And now the ionospheric data for Scotland and Northern Ireland. Daytime F2 critical frequencies at South Uist averaged 9.4MHz. This is slightly better than last week, and the increase is partly due to seasonal changes. The 15th saw a level of 11.2MHz, which was the best since last April, but the 16th fell to only 6.0MHz - possibly due to magnetic activity and aurora. The darkness hour lows did not change much and averaged 3.9MHz. Other phenomena and spread F were reported every day and lasted up to 11 hours on some days. It reached total levels for three hours in some early mornings.

And finally the solar forecast. The more active side of the sun will be facing Earth this week, and flux levels may rise to around 290. Geomagnetic levels are expected to be quiet. Ionospheric daytime M.U.F. levels at equal latitudes could rise to 33MHz in the south and 29MHz in the north. The darkness hour lows are not expected to change much, and 14MHz should be possible.

television by G8JUB. More information is available from G0LLJ on Nelson 67597.

Meetings on Wednesday the 27th

Stockport Radio Society meets at 7.45pm in the Dialstone Centre, Lisburne Lane for a surplus equipment sale. More information is available from G4ECI on 061-439 3831.

Alyn & Deeside Amateur Radio Society is changing its venue, and all members are asked to come along to the new one at 8pm. It's the British Steel Sports & Social Club, which is situated off the end of Rowleys Drive in Shotton. More information is available from GW1STJ on Wrexham 760702.

Meeting on Thursday the 28th

Fylde Amateur Radio Society meets at 7.30pm at the South Shore Lawn Tennis Club, Midgland Road, Blackpool for a talk on the tramways of Lancashire by G4IHF. More information is available from G4CSA on St Annes 720867.

Meetings on Friday the 29th

South Manchester Radio Club meets at 8pm in Sale Moor Community Centre, Norris Road, Sale for a talk on engine tuning by G1JPO. More information is available from G4BZO on 061-231 5870.

Maltby Amateur Radio Society meets at 7.30pm in the Parish Hall, Clifford Road, Hellaby for a talk on operating from difficult sites by G3YUF. On the following day the club is holding an Open Day at Maltby Comprehensive School in Braithwell Road in connection with Project YEAR. Different aspects of amateur radio will be demonstrated, using the callsign GB4MRS. More information is available from G1PQW on Rotherham 814135.

>and sometimes the military.

I don't believe this statement is absolutely true, since Civil Air Patrol is called in whether it be AT an airport or NOT at an airport. Of course, if the ELT signal begins to go out to sea (as one recently did here in Massachusetts), then CAP will generally call off the search, assuming that the ELT is on a boat instead (YES, boats DO have ELT-like devices, sometimes) and transfer the search effort over to the Coast Guard.

Civil Air Patrol finds that about 94% of ELTs that it searches for are those which are accidentally set off in some manner, and NOT real emergencies. In general, Civil Air Patrol has the authority to locate the ELT in question, attempt to locate the owner of the plane, and if all else fails, try to disable the ELT on their own. There are techniques for disabling the ELT which are described in various CAP literature, generally involving the use of aluminum foil. This doesn't help the batteries in the ELT any....but then again, FAA regs state that once a ELT has been set off, the batteries must be replaced anyway.

>
> For Vice Director: Kay C. Craigie, KC3LM
> James M. Mozley, W2BCH

(Lots more of the ARRL Letter deleted- no need to put everyone to
sleep :^))

I wonder, particularly from members of the ARRL Atlantic Division,
but in general from League members wherever a Division Director/
Vice Director election is taking place:

Has anybody received a ballot yet? I inadvertently deleted it from
the text above, but the Letter says ballots were to be mailed
starting September 10. I haven't received mine yet, and wondered if
anybody had, or if everybody had and mine was lost.

As you can see by my excerpt from the main text, I have a particular
interest in the Atlantic Division race. Seems our incumbent Director,
Hugh Turnbull, was one of the strongest lobbyists pushing the Board
of Directors for passage of the Bandplan change affecting the
902-928 MHz band. Mr. Turnbull is NOT ACTIVE on this or ANY OTHER
VHF/UHF band, and DID NOT SEEK the opinions of his constituents in the
Division who are active on the 33cm band!!! Yet he had the colossal
gall to appoint himself "chief lobbyist" and urged the Board's support
for a flawed plan, generated by the Membership Services Committee which
totally ignored the recommendations set forth by the VUAC. The
plan was adopted and is now official. This plan abolishes the weak
signal calling frequency at 903.1 MHz, and in its place, establishes
a high speed digital channel from 903.0 to 906.0 MHz.

I STRONGLY urge all Atlantic Division members to carefully weigh the two choices on the ballot (if and when you receive it) and ask why your current Director doesn't want to know what his constituency wants/needs, and just takes it upon himself to make a great change to a band that was just starting to "come into its own". I'm not saying his opposition is any better- I don't know Bob Weinstock, KN1K. However, I think his opinion on this subject (in particular) and on the subject of member input (in general) should be sought.

Off my soapbox now. I apologize for the wide distribution of this posting to people other than those directly affected, but maybe, if you are a 902 operator and your Director is up for re-election, you should ask HIM HOW HE VOTED, and base your vote on his response.

2959. Transmitting on Police Frequencies

Newsgroup: rec.ham-radio
Date: 1989-09-28 14:05:23 UTC
From: AXVSCCN@UICVMC.BITNET
Message-ID: <8909290702.AA06121@ucbvax.Berkeley.EDU>
Source record: 16592

I hope I didn't give anyone the idea that I would rather watch someone
bleed to death than take a chance of broadcasting on a police frequency.
My main point was/is that hams and non-police emergency personnel like
EMT's and volunteer fire fighters *should* attempt to use alternative
methods to contact help. Anybody can think up a scenario (horrible
school bus wreck at 3am in the middle of nowhere) where transmitting on
police frequencies could be justified --at least philosophically justified.
When you come up on such a situation, only you know what you will do.
I am against the idea that some hams and non-police people have of
preprogramming their radios with all sorts of emergency frequencies
and justifying such actions with statements like "when an emergency
comes up you don't have time to be reprogramming your radio". Face it
folks, hams are just regular citizens like John Q. Public. They do not become
emergency services workers, police officers, or fire fighters just by
getting an amateur radio license. True, they do have better communications
capabilities than the average Joe but this does not give them the right
to step out of their domain. Only you will know what is appropriate
when that time comes and you will have to face the consequences (good or bad)
for your actions. I just don't want to see hams and others using police
frequencies to report lost dogs and traffic violators (on a regular basis at
least) when pay phones, autopatches, CB's and other forms of communications
are available. It may not be convenient to walk a block to use a pay phone
but if it gets the job done and doesn't piss off the police it's worth it.

Yes, Hams routinely use them. They are referred to as "rubber duckies" when used with small handheld radios and greatly reduce the size and annoyance of a full size quarter wave whip while providing very nearly the same performance.

> remove on the mic jack to get the front cover off?

Yes, there is a retainer ring on the mic jack. I used a thin nose
pliers to get in and around it. It is a threaded nut, turn
counter-clockwise to remove.

> Also, has anyone successfully modified this radio as per the MOD found in
> bitlib@business.uwo.ca? Thanks in advance for help with this problem.

I have a 212RH, couldn't mod it and got an ICOM-228A!

I don't have access to the MOD info you cited. Would you please mail it
to me?

> have a copy of the FARs here at work, but believe that it is the case.
>
There are permitted uses for ELT's outside of aircraft. For
instance, boaters on the high seas frequently carry a form of the elt
called an EPIRB (emergency position indicating radio beacon). These
canisters might be located on the lifeboat, if there is one, or on the
bridge of the boat otherwise. They are activated either upon
submersion in water or by manual control. As far as I know, there are
two kinds: the ones carried by small boats within 50 miles or so of
the coast transmit on the VHF marine distress frequency, 156.800MHz.
The others, used farther at sea, transmit on the two aircraft distress
frequencies, to be picked up by aircraft and satellites.

I believe one needs a special marine permit, or at least an
endorsement for an existing marine radio license, to carry the EPIRB.
However, they are certainly legal when used properly. I remember when
I used to work around ocean marinas, someone would set one of these
off every few months, and the coast guard would swarm the area with
helicopters until they found the offending signal. They were not
really pleased with false alarms...

It seems there ought to be a variant of this beast to be
carried by backpackers and the like, especially as the satellites

which listen for them (GOES?) become more abundant and also more sophisticated. (Maybe if the ELT is registered to a particular owner and they must be returned to the factory after each use?) They ought to use a less consequential channel for starters, I imagine.

> addresses (and subway stops)? I'm not planning to buy anything,
> but I do want to look!

Akihabara is full of cramped buildings with *many* vendors and "stores".
It's more like Dayton crammed into 1/16th the space. About 1 in 10 or so of
these sell ham gear. The ham stores make ours look pitiful - they're jammed
to the gills with gear of all kinds. You don't need an address (they probably
don't even have one, for the most part - besides, addresses don't quite work
the same in Japan). Just take the train (JNR) to Akihabara - there are maps,
or ask someone at your hotel desk for directions. Also have them give you
a card with their name and address in case you get lost. I found the Japanese
very nice, helpful, and honest, and usually friendly.

Sunday is "shoppers paradise" - they block the streets off in the Akihabara
area and you can wander aimlessly.

In Shinjuku, just there is a good electronics area near Shinjuku station
(the rail station). Just a block or two south (I think) and a block west.
I don't recall many ham stores there, though.

You'll find that prices are not as good as you can get here though. But,
equipment selection is greater, and you'll see next years' electronics
(and maybe 1991 models, too). :-)

It's a blast - have fun.

>Rusty Carruth. Radio: N7IKQ
>DOMAIN: rusty@cadnetix.com UUCP:{uunet,boulder}!cadnetix!rusty
>home: POB. 461, Lafayette 80026

The 28.310 freq was my suggestion. I didn't have any pressing reasons for selecting it. The only issue was to select "a" frequency. So, let's just drop it and go exclusively with 410 and 390. Having just two close channels should make it easy to scan and increase the chance that we'll find each other.

The time of 1500Z sounds good. Some days I don't hear any signals that early - but 10 is a weird band and anything can happen. Let's keep trying until 1700Z. That should allow a good chance for catching some signals. And it gives us folks who sleep in on saturday a chance to get up and get on the air.

This coming saturday should be interesting. I'm helping a friend move and will be in the truck with the radio all morning. That'll give me a chance to catch up to Rusty for the W.A.S. I wonder if the ARRL will take Email QSL's for usenet W.A.S.?

On another issue - I picked up an IC60, 6 meter fm rig with rocks for 52.525 at the Boulder hamfest. Anybody have any experience or advice on 6 fm. I'm planning on using a low dipole at home and a 1/4 wave whip in the truck. What kind of results can I expect from my 10 watts.

I've just purchased an AEA PK-232 (as well as some other goodies!). I don't have possesion of the unit yet as I've been told that AEA is in the process of modifying the unit with a new "mailbox" feature.

Anyhow, I've been told that the MacRatt software for it (the Mac-ware that AEA flogs for the '232) is pretty difficault to get hold of... that PC ware was in greater supply. Also, frankly, after buying the '232, etc; I don't have $60 to spare for the blasted thing (even if I COULD get it!). Sooo, I'm looking elsewhere. Especially interested in WEFAX-ware.

Preferably something that could run under MultiFinder and happy with 6.0.3 would be nice. Any leads?

Many thanks,
Pete Ferris, N5KBD

Examining the traffic on this Group for that last few weeks/months/years , it seems that we need a new subgroup - "INFO-HAMS-PHILY", wherein all the *** continued *** "Philadelphia lawyer" exchanges could take place. From the content of this Group, you would think that the main interest of hams lies in endlessly interpreting all the "tea-leaves" of the FCC rules. Surely there must be a more dynamic side of hamdom, let's see it here.

An initial posting or two on a subject is usefully sent to the whole Group, but the N-teenth retort to a response to an allegation about the same subject tends to tie up message memory that could be better used on new stuff.

Or is it really more fun to talk about operating, than to actually operate, or build, or learn something technical, or ... ?

[Since the name of this proposed group has changed, I thought I'd re-post the call for discussion. Note that the discussion is aleady in progress and the vote will be in about 2 weeks.]

Purpose: to discuss issues of interest to short wave listeners, i.e. those who are interested in listening to programs on the shortwave bands (primarily but exclusively broadcast bands); also to discuss issues of interest to dx'ers working other broadcast bands (vhf, mw, tv).

Topics might include (but would not be limited to):

announcements of shortwave programs of interest
shortwave program schedule listings
shortwave program time & frequency changes
relevant magazine & journal recommendations
receiver and antenna reviews and recommendations
dx'ing tips & news
news of pirate and clandestine stations
politics of international broadcasting

The name "rec.radio.shortwave" was chosen to (a) introduce a new hierarchy "rec.radio" and (b) avoid puzzling acronyms like "swl" (although the latter is in common use within the community itself). At the start, articles on other kinds of broadcast-band dx'ing would be welcome on this group as well, although it is understood in advance that these topics may later be split off into groups of their own (probably under the new rec.radio hierarchy).

Followup discussion on news.groups.

Actually it is a little more complicated than Diana indicates.
The responsibility for search and rescue is is a multidimensional
matrix based on over land or over sea, county by county in some
states (California for sure), type of search objective (civilian
or military/classified) etc.

Authority must also vary. CAP in California has no authority on
private property whatsoever and except in clear life and death
situations does not enter or alter anything on private property
including ELT antennas without an owner, peace officer or responsible
party present.

Recently in Seattle someone shot a cop at a routine traffic stop, and paralyzed him. A helpful citizen grabbed the cops mike and announced what had happened. He was personally thanked by the police chief.

On the other hand, if you use your OWN radio on police frequencies to call in a disabled vehicle report, I don't think that they are likely to react the same way :)

Yes. On HF they are commonly called heli-whips. On VHF they are commonly called "rubber duckies".

Oh, come now. One of the most important problems in public safety communications is internal integrity. By that I mean when an officer (or firefighter) hears someone identifying himself as Captain Whatzisface, he wants to know damn well it IS Captain Whatzisface and not Joe Ham or Philmore Seabee playing games. Nobody wants to risk his life on the basis of a communications system whose security has been compromised.

Don't forget the FCC and CommAct provisions for using any means at hand in an emergency always add something to the effect "when normal means fail or are lacking". This means extreme situations like a boat at sea where you can't tie a hanky to the aerial or flag down an trucker or any of a zillion other, conventional methods.

There just is no practical need for getting on police frequencies. Indeed, since your transmissions will be viewed with suspicion, you will probably add to the delays in getting help.

Horrors! God forbid a ham should use CB Ch. 9, which most police units in the boonies, and many urban areas as well monitor routinely.

OK, use the police frequency. But which? There's more than 1, you know. Whose jurisdiction are you in. Do you use the state police frequency? If so, which district are you in? The sherrif's frequency, the township's, the forest ranger's?

Last but not least, once your injured party is transported, don't be surprised if you are asked if you want ketchup or mustard on your radio. Cops' lives depend on their radios and they just flat out don't like intruders - legalities be damned.

From: UNCFTW@UNC.BITNET
Message-ID: <KPETERSEN.12530031025.BABYL@WSMR-SIMTEL20.ARMY.MIL>
Source record: 16597

Is there a collection of Public Safety 10 Codes and Signals archived on any of the networks? I am familar with the Police Communicators Association "official" 10 codes. But there seems to be a considerable difference in use between departments. I have found a 20% difference in meaning for these codes between a local police department and the NC Highway Patrol. A comparison between a recent posting of 10 codes for a different area of the country and my lists indicated a 60% difference.

Thanks for any help,

Frank Winstead

Well I don't know what kind of department you worked for but mine would consider your attitude recklessly negligent - and so likely would the victim's lawyer if he found out about it. It disturbs me greatly that procedure would take presidence (sp) over breaking them and saving a life. Such elitism illustrates the "civilians-vs-us" mentality that exists in many departments today. Sad.

My old agency (Bradley County, TN Emergency Management Agency) would welcome any LEGITIMATE life-and-death communications. Sure, the dispatcher would endeavor to verify the authenticity of the caller but he/she would always err on the side of caution and roll if there is the least bit of credibility.

The problem is determining what is a real emergency. Judging by local autopatch traffic, most hams have no sense of reality in this area. I daily listen to someone go through the rather clumsy patch procedure, get 911 through a noisy and picket-fence connection, and then shout the emergency - which may only be an abandoned car - as if it were an immediate life-or-death situation. Meanwhile, 10 or 15 cellphone equipped drivers have called the same incident in over a nice quiet reliable channel.

What is even sadder was when I arranged for a training officer to come over to a ham meeting to train them in proper tactical communications/ dispatcher techniques. Nobody showed up despite wide publicity. Guess the hams thought they knew how to communicate better than those that do it for a living. Guess it must be CW :-) Yeah! That's the ticket! Replace all the 10- and Signal codes with CW. But I digress.

So what would justify operating on public service bands?

A car wreck on a well traveled road? No, see above.
A car wreck with casualties on the same road? Still NO. Other means are available.
A car wreck with casualties on a rural road at night? Sure. You might save a life.
A car wreck in the same setting with no casulties? Nope. Sorry.
A farmhouse on fire out in the country? Sure. Someone may be trapped and it is likely no one else has seen it.

It is really rather simple when you think about it. Is someone critically hurt such that the golden hour may be running? And is there no other channel of communication available? Is some other life-threatening hazard occuring? Such as a large propane tank on fire. Simply imagine the same situation except that you have a police radio in your hand instead of an HT and the officer is down. Would you call then? sure.

And in the end, if I had to make a choice between possibly breaking a rule and saving a life, the rule would bite the dust. Worst case, I'd gladly trust the judgement of a jury of possible victims.

John

How to carry a scanner (or any other receiver) legally - anywhere!
Dont know if its the same in the States, but here in the UK, us hams are
required to be able to verify our transmit frequency, and also to be able to
test for the presence of harmonics, spurii etc. from our transmitters,
to the satisfaction of Government officials.
Now it just so happens that a scanner is a very good,
sensitive detector of these spurii, harmonics etc. that just *MAY* fall on
police/fire/emergency frequencies.
Most people just use a wavemeter or dip oscillator, but a scanner is
SO much more sensitive (and hence shows you have a real zeal
for cutting down your spurii to the lowest possible level......!)
Possible excuse for having a scanner tuned to police: 'Well, officer, i was
simply using it to ensure that i wasnt transmitting any harmonics that could
be affecting your radio....'

Next thing we know, there will be legislation banning spectrum analysers.

>fast.
>
This happened some time ago, and commercial radios now cannot be programmed
without the use of some external device. In the past, the requirement
was the programming had to be internally disabled, usually with a
juper or solder pad (sound familiar?).

For example, Fujitsu now requires the use of a specially programmed
EPROM in their radios to enable programming, which the dealer remove
when he is done. The radio cannot transmit with this EPROM in place,
so it cannot be left in place. I've also seen radios that require a
separate programming module that has to be plugged in to enable programming.

Fujitsu is bringing out shortly a PC interface that does allows programming
via the front keypad or via a serial port connected to a PC running
proprietary software. In each of the above cases, the material must
be returned to the mfr. on lapsing of dealership status.

Also note that all commercial radios must now be designed so they cannot
operate in frequencies outside their type acceptances. I was very dissapointed
to learn that I cannot use the Fujistu radios on 2m freqs. Even though
we are a legitimate dealer, the factory refuses to give us software that
allows out of commercial band programming. I am told this is now the
case with most other commercial radios mfr's.

In fact I know of no commercial type accepted radio that is current
production that there is any way to program ham 2m freqs. into. I know
the non-US versions of many radios will do it, but no mfr. will make
the necessary parts/info available. I think they are concerned about
violating the type acceptance rules and FCC rulings concerning modifications

voiding type acceptances.

I am unsure how long the out-of-commercial band prohibition has been in effect, but I would like to purchase a radio, such as the Yeasu that John mentioned is owned by his friend. Does anyone have a list of older model type accepted commercial radios that will:

a) allow keypad programming with installation of a jumper
b) allow programming into the 2m band
c) allow the other necesaary feature for amateur operation
i.e. +/- 600khz, tone-burst and/or sub-audible tone, etc.

This is the only way I can look for a workable unit at Hamfests and/or used equiment listings.

My thanks to John De Armond WD4OQC for contributing to this discussion.

I've discussed this topic with others, to no avail, in the past. Perhaps someone on the net can shed some light on this and maybe even suggest some suitable radios for those of us who now have to carry to two radios around most of the time.

2986. Ariane launch V34, 35, and 36 delayed

Newsgroup: rec.ham-radio
Date: 1989-09-29 18:20:24 UTC
From: mac@idacrd.UUCP
Message-ID: <472@idacrd.UUCP>
Source record: 16609
Cross-posted to: rec.ham-radio,sci.space

Arianespace called us yesterday to tell us that they have found that pyro initiators on the Ariane 4 third stage on V34, 35, and 36 have been found to be sufficiently out of spec that a considerable delay in our launch (Microsats along with Spot-2) of at least a month is to be anticipated. We are quite happy with the quality control people at Arianespace. They really don't let much get by them and this another instance of why they are about the most successful launchers in the world at the moment and getting better. For those of you looking forward to a November use of the UOSAT's or the Microsat's I believe that is now looking like January.

****

THE LARGEST HAM RADIO AND ELECTRONICS
FLEA MARKET IN NEW ENGLAND
OCTOBER 6-7 1989

The fall edition of the HOSS TRADERS ham radio and electronics
flea market will be held Saturday OCTOBER 7 starting at DAWN at the
DEERFIELD FAIR GROUNDS, DEERFIELD N.H. The fair grounds are located on
RT-43, a few miles off of RT-101. RT-101 is directly accessible from RT-93
in New Hampshire. Talk-in is available on 147.00 (rpt) and 146.52.

The spring edition of this flea was the best ever with some estimates
of as many as 10,000 people attending !! There is plenty of food, and
parking available.

For people who want the BEST DEALS, the flea market actually begins
FRIDAY at about NOON and continues into the night. Bring a flashlight,
a smooth and phillips screw driver and a jacket. When selling, I usually
sell out by friday night. Camping is available.

Admission is $5.00. Camping fee is slightly more. ALL PROFITS go to the
Shriners CHILDRENS BURN CENTER in BOSTON. There is NO additional fee for
sellers. Now is the time to trade your junk for someone elses :-)

NEW EQUIPMENT DEALERS will be there also ! No SALES TAX in NH !
^^^^^^^^^^^^^^^^^^^^

Get there early !!!
73
GENE WA1UXA

DISCLAIMER: I have no connection with the flea market or the
Shriners. I just love big flea markets with lots of junk !! :-)

2990. Re: sell radios to the unlicensed

Newsgroup: rec.ham-radio
Date: 1989-09-29 21:34:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500212@ux1.cso.uiuc.edu>
Source record: 16613

There is a definite need for some sort of ELT-like facility for terristrial emergency location outside of aviation.

Such a need includes the need for a sophisticated satellited and ground based monitoring system as well. This all costs money.

Perhaps the only way to do this is to specifically outlaw ownership of transmitters on the particular frequency except by agencies and/or corporations licensed to rent them out to whoever needs them. There would be a deposit and rent for use. The deposit would be returned if the transmitter is never used. There would also be an appropriate charge for certain portions of the cost of the search and rescue should that be necessary.

> frequencies. Guess which course they'd pick?

I basically agree. Discounting the concept of police who are hams doing this, we need to make sure that no one gets the wrong impression of this rule. The rules does say "when normal communications are unavailable", and ham radio can be consider (at least by us) as normally communications. Only as a last resort and when time is essential would I transmit on a police frequency, being fully aware of all the hassle I will be getting myself into over the matter.

Some of us still believe we have cause to modify our radios for out of band transmission. It sure would be nice if the radio manufacturers would at least give us some protection mechanism for it, such as a secret code we can set to be punched in to invoke the mod each time the radio is turned on (after the requisite internal hardware change is done). Also, OTHER kinds of mods, such as adding an extra digit, features, etc, should be EASIER to do (like dips switches) than the out-of-band-transmit mod, so fewer people would be tempted to just do it while they are doing other mods. I cut a diode in my Kenwood TS-440 to enable 10 hz digit. It took a lot of work getting in to that point to do it. The out-of-band transmit diode (cut another one) was very close nearby. I was tempted to do it, but at the last minuted decided not to.

> is available.

Whoa! Stop! Halt! ^c ^c ^c ^c!

In recent years this has become a serious problem. The fairground does
not open until 04:00 pm Friday. The gates will be closed and the curios
will be turned away. Don't plan on arriving before 04:00 pm.

This article has been posted on behalf of Joe, K1RQG, Hamfest Chairman.
If you have any questions about this, please contact him. Thank you and
hope you get to Deerfield this year.

I have found the WARC bands (10,18,24 mhz.) to be a refuge for those running appropriate power (i.e. Barefoot) and simple antennas to carry on conversation --- 18 Mhz. is close enough to 20 Meters to give similar propagation.

I also recently got on 220 (in Utah) and found it to be an interesting group of people... something about the less crowded atmosphere make people a little less stressed out.

Try getting on some of the less utilized spectrum and I think you will enjoy the hobby (SWL or Amateur Radio) much more.

Listen, I don't know about the others, but I have been speaking from the point of view of the practical effectiveness. Legalities aside, getting on a police frequency is the least practical solution to the problem in 999 cases out of 1000. If you're sure you've got that #1000, go for it.

2995. HT TALK

Newsgroup: rec.ham-radio
Date: 1989-09-30 04:40:15 UTC
From: cep4478@ultb.UUCP
Message-ID: <1343@ultb.UUCP>
Source record: 16616

For those who like to talk about HT's ... has everybody seen the ad for the IC-2SAT? Boy, it looks neat ... just going by the manufacturer's spec sheet, the thing is teeny, 48 memories, 2 watts out with the battery pack (it's INTERNAL, not removable) and 5 watts on 13.8v external, and Rx 138-174.

It looks really neat, and I'd like some feedback if anybody has bought one of these things. It's not cheap though - the 2SA lists for $419. (I'm not sure what the difference between a 2SA and a 2SAT is).

With regard to my TH-215: I love it, it's lots of fun, etc. but two complaints. First, when the battery dies, the indicator gives you so little warning that it may as well not be there. For one thing, when I'm transmitting, I'm generally not looking at the LCD screen, so I don't see the BATT indicator, anyhow, and if I'm not carrying my battery it does w/o legal ID time. The second thing that gets on my nerves is a personal thing, and not the radio's fault: I do wish it was a little smaller so I could put it in my pocket, rather than on my belt.

Oh yes, one other thing, while on the topic of HT's: if you don't already own a Kulduckie or Kulduckie clone, and are using a stock rubber duckie, you're missing something extraordinary. The part-helical-part-quarterwave type antennas are SOOO much better than a stock 1/4 wave.

Not if one of them is a geranium. Seriously, the three REC.HAM-RADIO newsgroups are closely similar. A shortwave listener newsgroup is only barely similar to the three originals.

SpaceNews

MONDAY OCTOBER 2, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* SHUTTLE NEWS *

Workers are continuing their investigation into the accidental dousing of COLUMBIA at the Orbiter Processing Facility on 24Sep89, when a "firex" fire extinguisher system was accidentally triggered. COLUMBIA was being readied for the STS-32 mission in mid-December when the accident occurred.

Work continues on launch preparations for ATLANTIS. A Flight Readiness Review is scheduled this week on October 2 and 3 at the Kennedy Space Center. The earliest possible launch window for STS-34 opens at 1:29 PM Eastern Time (1729 UTC) on Thursday, October 12th.

* OSCAR-9 NEWS *

The "unofficial KD2BD" OSCAR-9 re-entry date is 07Oct89 at 1912 UTC (+/- one day). OSCAR-9 was launched on October 6, 1981, so it should last long enough to see its 8th birthday on Friday!

The following is a "raw" telemetry frame received from OSCAR-9 on 30Sep89 at 15:04:49 UTC:

UOSAT-1 8909300150449 COMPUTER GENERATED TELEMETRY

[Inline base64-encoded payload not displayed]

* MICROSAT NEWS *

The multiple UoSAT/MicroSat launch orginally scheduled for a November 9th has been delayed 2 weeks due to a problem on board the Ariane 4 launch vehicle. This delay provides UoSAT and MicroSat engineers some extra time to carry out precise measurements and calibrations of all the systems on the satellites. Approximately one month before launch, the two UoSATs and four MicroSats will be integrated with launcher. After that, the main payload, the SPOT-2 spacecraft, will be mounted on the Ariane rocket.

* UoSAT D/E NEWS *

UoSAT-D and UoSAT-E were both removed from thermal vacuum testing last Monday afternoon after completing four hot and three cold cycles. The satellites internal temperatures were cycled between -30 and +50 degrees C. These tests provided UoSAT engineers with their first long period analysis of UoSAT-D/E operations, and enabled them to excercise all systems during the 5-day test. Both spacecraft performed well throughout the temperature cycling. Engineers installed a telemetry temperature sensor directly on the 80C186 processor in the PCE and found that it consistantly runs 10 degrees hotter than its surroundings. There was some fear that this processor, in its 68-pin grid array package might develop into an undesirable "hot spot", but this did not occur. The RF systems, including the 10-watt power amplifier for use during PACSAT experiments operated without difficulties throughout the tests.

Both the temperature cycling and the prolonged operational test did identify some minor problems in each satellite. The navigation magnetometers appeared to be temperature sensitive, but functioned perfectly at the expected operational temperature, and the over-current protection tripped on some power switches unnecessarily at low temperatures.

These problems are now being investigated at the University of Surrey prior to the shipment of the two satellites to Kourou.

* OSCAR-11 NEWS *

The following is an OSCAR-11 On-Board Computer status bulletin transmitted by OSCAR-11 on 30Sep89 at 14:48:25 UTC:

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

3001. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1989-10-01 00:15:57 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8910010705.AA03986@ucbvax.Berkeley.EDU>
Source record: 16626

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

Date: 1989-10-01 02:11:11 UTC
From: doug@edson.ee.UAlberta.ca
Message-ID: <1989Oct1.021111.2577@edson.ee.UAlberta.ca>
Source record: 16528

Do any of you have any experience with a program called MINIPROP? It is a propagation forcaster written by Shel Shallon, W6EL.

Does it work? Is it more useful than other techniques?

Please email, I will summarize...

Doug Konrad, VE6DJK

alberta!edson!doug
(alberta is on the backbone, and should be known by most pathalias's out there.)

In article <5440009@hpcvck.CV.HP.COM> mcross@hpcvck.CV.HP.COM (Minor Cross) writes:
:I would suggest that your friend look into ICOM commerical handhelds.
:These radios can be modified to accept keyboard freq entry and
:will work on the commerical band (legally) as well as the ham bands.

The ICOM handhelds are wonderful. They hold up like a tank. Real nice radios.

Speaking of mods...
We have a couple ICOM IC-02AT's at work. They have been modified to stay
locked up to about 155 MGHz. We will probably need them to go higher for
use during a concert set-up outside the USA (the local contractor uses
something around 159 or so, I really don't recall it's been so long).
Can someone email (or post if you think it would be helpful) instructions
on what the mod is to let the 02AT's tune the widest set of frequencies
(antenna being the limit of course). I was promised the mod by a friend
and he forgot to give it to me, so I've dropped by here to see if I can
get a helping hand.

Thanks for any help.

Joel

That's strange ... I just ftp the latest maps, and couldn't find arrlhq in the
CT map.

Am I missing something?

GATEWAY: The ARRL Packet Radio Newsletter
Volume 6, Number 1 - September 22, 1989 - Part 1 of 3

Published by The American Radio Relay League
225 Main Street, Newington, CT 06111

Stan Horzepa, WA1LOU, Editor

HAPN-1 SOFTWARE ENHANCED

The HAPN-1 packet-radio adapter software has a fresh look! The long-awaited multiconnection software is now available, the AX.25 software package has been extensively rewritten and new programs have been added to the library. [HAPN-1 is a hardware and software package developed by the Hamilton (Ontario) Area Packet Network (HAPN) for the IBM PC and its clones that consists of a TNC on a PC card that is installed in a computer expansion slot and a variety of software to support the hardware.]

Software Reorganization

The AX.25 Level 1 functions have been broken out of the m25 program and placed in a device driver. The device driver, hapn1.sys, is loaded from your config.sys file and becomes part of DOS. It manages all of the hardware functions associated with the HAPN-1 hardware. This greatly smplifies m25 and makes it possible to extend it to support new features such as multiconnections. In addition, the device driver is similar to a TNC running KISS code, which makes it suitable for use by other applications that already contain Level 2 functions, such as TCP/IP.

Multiconnect

M25 can be customized to provide one to four concurrent connections or sessions (HAPN has found that two or three sessions are sufficient for most users; fewer sessions means that m25 uses less memory). In addition to th connected sessions, there is one special session called the monitor session that is active all of the time. It permits you to monitor the channel even when connected.

The c25 program supports multiple sessions by allowing you to switch from one session to the next by pressing a function key. Information about the session, such as session identification and the connected station's call sign, are provided for each session, making the use of multiple connectons

very simple and easy to use. File transmission and reception operates in all sessions as do the file transfer utility programs.

A new "calls heard" dialog is now available in c25. It displays the last ten different call signs heard in the monitor session with the time when they were last heard.

New Applications

The Bulletin Board and Utilities diskettes now contains XPacket and YAPP file transfer programs, in addition to the old sf/rf programs. These new programs are compatible with PBBSs that support these protocols makin it much easier to exchange files with them.

There is also a weather facsimile program for receiving WEFAX images from various sources on HF and displaying them on your PC. All that is required is that you apply the received audio from your HF receiver to the HAPN-1 and tune in one of the WEFAX transmissions on HF. No hardware changes are required.

HAPN also provides a NET/ROM utility called SIGNON for remotely accessing and updating parameters in the node. The program automatcally performs the password sign-on procedure for NET/ROM SYSOPs. After the sign-on procedure, changing parameters is done by an editor showing the formatted parameters. Non-SYSOPs cannot change the parameters, but are still able to browse through them and learn more about the network. Formatted setups can be printed or saved to disk.

TCP/IP

A version of the TCP/IP program NET.EXE is available from HAPN that supports HAPN-1 using the new device driver hapn1.sys. This version is very reliable and overcomes all the HAPN-1 problems users were having with the released version of NET.EXE.

Incompatibility With MSYS Multi-User PBBS

An incompatibility between the HAPN-1 software and the MSYS PBBS exists. The symptom is the uncontrolled display of headers when an MSYS frame is received. This occurs because MSYS transmits incorrect SSID bytes in the AX.25 header. Most TNCs have been programmed to ignore the unused bits and function normally, however, the HAPN-1 software expects the bits to be set according to the protocol and malfunctions when incorrect framesare encountered. This problem has been fixed in the current release of the software.

8th ARRL COMPUTER NETWORKING CONFERENCE

The 8th ARRL Computer Networking conference will be in Colorado Springs, Colorado, on October 7 at the US Air Force Academy. This year's hosts include: Tucson Amateur Packet Radio (TAPR), Academy Amateur Radio Club, USAFA Cadet Radio Club, Rocky Mountain Packet Radio Association (RMPRA) and the American Radio Relay League (ARRL). Numerous papers on TCP/IP and ROSE Networking have been received for this year's conference. This year's presentations will continue the story of amateur packet radio and AMTOR evolution. This is one conference you don't want to miss. It's not too late to send in your reservation. Contact Lori Weinberg at ARRL or TAPR President Andy Freeborn, N0CCZ, at 719-598-8373 for more information.

Conference proceedings will be available at the Conference, or directly from ARRL HQ after the Conference. Papers contained in this year's edition are:

A Packet Broadcast Protocol, by J. Gordon Beattie, Jr., N2DSY

Licen-Free Spread Spectrum Packet Radio, by Albert G. Broscius, N3FCT

The Implications of High-Speed RF Networking, by Mike Chepponis, K3MC, Glenn Elmore, N6GN, Bdale Garbee, N3EUA, Phil Karn, KA9Q, and Kevin Rowett, N6RCE

Local Distribution in the Amateur Radio Environment, by F. Davoli, A. Giordano, I1TD, and S. Zappatore, IW1PTR

Implementation of a 1 Mbps Packet Data Link, by Glenn Elmore, N6GN and Kevin Rowett, N6RCE

A Personal Packet Radio Mailbox Using Roserver, by AndreFunk, KB7UV

Design of a Next-Generation Packet Network, by Bdale Garbee, N3EUA

RADIOSERVER - A Package for TNC Access to a LAN in a UNIX System, by A. Giordano, I1TD and S. Zappatore, IW1PTR

A Study of High Speed Packet Radio, by Roy E. Gould, N5RG

Prioritized Acknowledgement (PRIACK) Protocol, by Eric Gustafson, N7CL

Routing, Oh Where is My International Routing, by William C. Hast, TI3DJT

KA9Q Internet Protocol Package on the Apple Macintosh, by Dewayne Hendricks, WA8DZP and Doug Thom, N6OYU

Protocol Level 8 or What About the Use?, by Lyle Johnson, WA7GXD

Thoughts on an Adaptive Link Level Protocol, by Lyle Johnson, WA7GXD

Tucson Amateur Packet Radio packetRADIO Project, by Greg Jones, WD5IVD

Amateur TCP/IP in 1989, by Phil Karn, KA9Q

OSI Services on TCP/IP Networks, by Anders Klemets, SM0RGV and Stephen Pink, KF1Y

ATS-3 Packet Experiments: The Potential Impact of Packet Radio upon Pacific Basin Communications, by Gerald A. Knezek, KB5EWV and Greg Jones, WD5IV

ARES/Data UPDATE: A Packet Radio Batabase for Emergency Communications with Conference Bridge, by W.E. Moerner, WN6I, Sharon Moerner, N6MWD, and David Palmer, N6KL

ROSE X.25 Network Growth, by Thomas A. Moulton, W2VY

The ROSE X.25 Packet Switch, by Thomas A. Moulton, W2VY

Using the ROSE X.25 Packet Network, by Thomas A. Moulton, W2VY

AMTEX - NAVTEX-Like Dissemination Procedures for Amateur Radio, by Paul Newland, AD7I

A Multi-Channel IBM PC Packet Interface, by Henk Peek, PA0HZP

Design and Implementation of an AppleTalk Local Area Network Bridge, by R. Ramsey andW. Kinsner, VE4WK

DAMA - A New Method of Handling Packets?, by Detlef J. Schmidt, DK4EG

Application Software for Packet Radio, by Robert Taylor, KA6NAN and Dewayne Hendricks, WA8DZP

Callsign Server for the KA9Q Internet Protocol Package, by Douglas Thom, N6OYU and Dewayne Hendricks, WA8DZP

A Brief Report on the Implementation of ROSE Networking, by Barry E. White, VK2AAB

KANTRONICS RF MODEM COMING SOON

Kantronics, is expected to introduce an inexpensive 2-meter 9600-baud transceiver and TNC combo shortly. Dubbed the "DVR-2," the unit combines a 2-watt, 2-channel, crystal-controlled 2-meter transceiver with a TNC and a 9600-baud modem.

REPEATER DIRECTORY DEADLINE APPROACHES

The deadline for the 1990-1991 edition of the ARRL Repeater Directory is approaching, so, if you would like your 24-hour packet-radio system included in the next edition, please submit information about your system(s) in the following format soon.

STATE/PROVINCE
LOCATION: city, town, hill, etc
FREQUENCY: include frequency offset for full-duplex repeaters and include each frequency used for multiport operations
CALL SIGN
NOTES: include system type (digipeater, gateway, PBBS, node, switch, other), coverage area (radius in miles) and links (if you are a single-hop link between two or more systems, please list them)

SPONSOR: club name or individual call sign
SOURCE: source of this information

Please submit the information to:

ARRL
Repeater Directory Editor
225 Main St
Newington, CT 06111

Organizations with multiple listings are invited to submit data on MS-DOS 5-1/4-inch diskettes.

Due to the great number of possible responses, this information will be used to determine the major systems. Only major systems will be listed in the directory.

MICROSAT THERMAL TESTING

All four of the AMSAT MICROSAT satellites were received at the Martin-Marietta Space Simulation Laboratory (SSL) building where they underwent the very important thermal vacuum chamber test. This test creates a space-like environment. Each Microsat (PACSAT, LUSAT, DOE and WEBERSAT) was carefully mounted onto a special fixture designed to slide into the test chamber, after which the entire fixture was rolled into the 5- by 10-foot chamber. Once inside, Bob McGwier, N4HY, was "inserted" (very carefully, holding his body rigid so as not to touch any part of the Microsats) into the test chamber to complete the task of connecting the RF, power and data cables to a feedthrough connector, which enabled the AMSAT Team to test the equipment without losing chamber pressure. After cabling, the chamber was checked for leaks; then the door was closed and sealed.

The first part of the test was to wait for the chamber to be evacuated to the same pressure that a spacecraft would feel in space. Once chamber pressure was reduced to 10-6 torr, the Martin-Marietta technicians proceeded to raise the chamber temperature to +45 degrees C. At this temperature, each Microsat underwent a complete 12-hour functional checkout. This "hot-dwell" period allowed for outgassing to collect on the "cold plate". Out-gassing is a phenomena similar to what you'd see when a soda can is first opened. In a vacuum, most electrical components will experience outgassing of material and that material is collected on a metal plate (the cold plate) to prevent residue from adhering to the spacecraft. After thermal vacuum testing, the cold plate is chemically analyzed to determine where the residue originated. After 48 hours of thermal vacuum testing, all Microsats were functioning perfectly.

The Microsats continued through an 18-hour cold-dwell where the temperature is brought from -15 to -25 degrees C. Some problem did occur during testing (reluctant receiver channel and sticky CPU resets) and were corrected after removal from the thermal vacuum testing chamber. The Microsats were returned to Boulder for inspection and to be prepared for vibration tests which took place earlier this week. From there, they will return to Boulder for their September 25 trip to Kourou, French Guiana where the

Microsats are scheduled for launch on November 10.

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail to:

Gateway
Stan Horzepa, WA1LOU
75 Kreger Drive
Wolcott, CT 06716-2702

or electronically, via CompuServe to user ID 70645,247 or via Internet to 70645.247@compuserve.com. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s. (Personal messages may be sent to your Gateway editor via packet radio to: WA1LOU @ W1AW.)

The deadline for each issue of Gateway is the Saturday preceding the issue date (which is typically a Friday).

REPRODUCTION OF GATEWAY MATERIAL

Material may be excerpted from Gateway without prior permission, provided that the original contributor is credited and Gateway is identified as the source.

RTTY DX NOTES FOR WEEKENDING 29TH SEPTEMBER 1989
BID RTDX2909
Part 1 of 2.

LAST WEEKEND WAS THE CQWW RTTY DX CONTEST. FROM THE REPORTS THAT I HAVE
RECEIVED THERE WERE A FAIR NUMBER OF STATIONS ACTIVE. ONE STATION REPORTED
1050 CONTACTS. HE MIGHT HAVE A GOOD SCORE I THINK. OTHERS STATED THAT IT
SHOULD BE ENTERED IN THE GUINESS BOOK OF RECORDS AS THE GREATEST NUMBER OF
PEOPLE PARTICIPATING, ALL BANDS OPERATING AT THE SAME TIME, THE MOST WELL
BEHAVED OPERATION BY ALL, AND OTHER GOOD THINGS. MAYBE, JUST MAYBE, WE ARE
STARTING TO GET THAT OLD CONTEST LINLING BACK AGAIN. WE HOPE SO.

OUR THANKS THIS WEEK GO TO OD5NG, I5FLN, G3XTL, JA1BVL, TG9GT, VU2SJV,
N2HOS AND W1DA WITH VE3JPC, W0LHS AND CT1DIA ALSO REPORTING IN. THANKS FOR
ALL THE INFORMATION. THIS WEEK I CAN ASSURE YOU THAT SOME SEVERE EDITING
WAS NECESSARY. THAT CONTEST SURE BROUGHT THEM OUT OF THE WOODWORK.

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Ingemar Sandberg.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2062

-------------------------------------------------------------------------------

CORDLESS TELEPHONES--A new generation of cordless telephones is appearing in
Europe, which are being called "the poor man's mobile telephone". At the same
time, the current cordless phones in Sweden cost more than cellular
telephones in many other countries.

Cordless telephones have become popular all over the Western World and the
Far East. The exception is Sweden, where cordless telephones remain too
expensive for ordinary households. In fact, Swedish cordless telephones cost
more than the mobile or cellular telephones used in automobiles in other
countries.

This is because Sweden uses a unique frequency band for its cordless phones.
The kind found in the rest of the world use frequencies around 49 MHz. This
band is, however, still used by television in Sweden. Two transmitters for
Swedish Channel 1 use frequencies close to 49 MHz. Rather than move those two
transmitters, Swedish Telecom has decided that cordless phones in this
country shuld use the exotic frequencies of 914 and 959 MHz. Because of this,
the legal cordless phones sold in Sweden cost as much as 10 times what
similar units cost abroad.

Consequently, many Swedes buy cordless phones in other countries and try to
smuggle them past Customs. So far this year Swedish Customs has confiscated
1500 to 2000 cordless telephones. That's roughly twice as many as during all
of last year.

Now Britain has begun testing the next generation of cordless phones, called
CT-2. This operates at 864 MHz, using special digital signals. When you use
```

CT-2, you carry the handset in your pocket, and around town there are relay stations called phonepoints, instead of traditional phone booths. The idea is that you can call out from anywhere within range of a phonepoint, although you can't receive calls. That's why the system is being called the poor man's mobile telephone.

The pilot service has only 100 users and 30 phonepoints, all in London. The service is expected to cover all of London by the end of this month, and 1000 phonepoints are to be installed during the first year. When Britain is fully wired, there will be 16,000 phonepoints.

The British decision is controversial, because European standards have yet to be decided. Britain hopes to sell its CT-2 system to the rest of Euyrope, so that the same pocket telephone can be used anywhere in the continent. It now looks as thought the French have accepted the British system, for their "Pointel" public cordless network.

Happily for Swedes, Swedish Telecom has indicated it will adhere to the forthcoming international standard for CT-2. (George Wood)

SPACE--After more than 400 lift-offs, NASA launched its last unmanned rocket from Cape Canaveral, Florida Monday September 25th. The final launch was a 125 million dollar navy communications satellite called Fleet Communications Satellite, or FLTSATCOM-8. It is the last of a series of satellites which provide orbiting switchboards to link land, sea, and air forces around the world with the American Joint Chiefs of Staff, the National Command Authority, and the President's Military Command Network. (Dow Jones)

AFGHANISTAN--Updating SCDX-2044 Radio Afghanistan's broadcast in Urdu is now at 13:30-14:00 hrs on 6100 and 4775 kHz. (Salil Kumar Paul, India)

ARGENTINA--Reception reports to Radio Korea can now be sent to the following address in Argentina: Wansu Park, Radio Korea, Embajada de la Republica de Korea, Avenida del Libertador 2257, Codigo Postal 1425, Buenos Aires, Argentina. (Jorge Garcia, Argentina)

AUSTRIA--Radio Austria International has introduced programs in Arabic. Since September 24th there is Arabic on Sundays at 05:05-05:30 on 6155, 13730, 15410 and 21490 with a repeat at 19:05-19:30 on 5945, 6155, 12010 and 13730 kHz. (Harry Niebuhr, West Germany, Paul Gager and Manfred Schida, Austria)

BANGLA DESH--The external service of Radio Bangla Desh uses the unannounced frequency of 17978 kHz between 07:00 and 08:00. English at 12:30-13:00 uses the new frequency of 17910 kHz. (S.Anand, India and Don Hosmer, USA in Glenn Hauser's "DX Listening Digest")

BELGIUM--The new English schedule of the BRT is as follows: 00:30 on 9925 kHz, 08:00 on 6035, 11695 and 21815 kHz, at 10:00 on 21810 and 26050 kHz, at 13:30 on 21810 and 21815 kHz, at 16:30 on 17580 and 21810 kHz, at 18:30 on 1512, 5910 and 11695 kHz and at 22:00 on 1512, 5910 and 9925 kHz. (Harry Niebuhr)

French to Europe from RTBF is broadcast as follows: weekdays: 06:30-07:35 on 5965 kHz, 11:00-13:00 and 16:00-16:45 on 9925 kHz. Saturdays: 06:30-07:30 on 5965 kHz, 07:30-13:05 and 16:00-16:45 on 9925 kHz. Sundays: 06:30-07:30 on 5965 kHz and 07:45-16:45 on 9925 kHz. (Francois Chalory, France)

CAPE VERDE ISLANDS--Updating SCDX-2019, three 500 kilowatt commercial shortwave transmitters will be installed soon by the French Company "Media Connection International". The project will be operational in 1991 and it will broadcast commercial programs towards the Americas, Africa, Southern Europe and the Middle East. (AFP New agency via BBC Monitoring)

COSTA RICA--French programs from Adventist World Radio are broadcast daily except Saturdays at 11:00-12:00 on 11870 kHz. (Andre Hemlin, Quebec, Canada)

HONG KONG/TAIWAN--The world's first underwater optical fiber telecommunications system is planned to be built between Hong Kong and Taiwan. The 730 kilometer line will carry data, facsimile and video signals as well as voice communication. It will operate at a rate of 420 Megabits per second. (Vitaly Liberny, USSR)

IVORY COAST--Radiodiffusion Television Ivorienne has drifted away from its nominal frequency of 7215 kHz to 7208. (Thomas Sundstrom, USA)

NETHERLANDS--A couple of changes in Radio Netherlands schedule valid from September 24th: English at 10:30 is on new 9505 kHz and English at 11:30 is on new 21615 kHz. (A. Ghiri and Ajay Kumar, India)

PHILIPPINES--Radio Veritas Asia has moved from 11735 to 11820 kHz for their Tamil and Sinhala broadcast at 00:00-00:55. (Salil Kumar Paul, India)

POLAND--The London Correspondent of PAP news agency learned about a project to build in Warsaw a satellite transmission station which would make it possible for residents of Warsaw and nearby localities to receive BBC World Service 24 hours a day as well as BBC Polish programs to be aired on VHF. (BBC Monitoring)

SYRIA--Radio Damascus broadcasts to Europe in Russian at 17:00-18:00 on 12085. German at 18:05, French at 19:05 and English at 20:05 are on new 9950 and 12085 kHz. (Vitali Liberny and Thomas Sundstrom)

UNITED KINGDOM--BBC World Service has just added two new 250 kW transmitters and four new antennas to its relay base on Ascension Island in the Atlantic. These are to be used for broadcasts to South America in Spanish and Portuguese and to West Africa in English, French, and Hausa. (Reuters, BBC)

USSR--Radio Kiev's new schedule reads: 18:00-18:30 to Europe on 9600, 7240, 7205 and 7150 kHz. At 23:30-24:00 and 02:00-02:30 on 17690, 17665, 15180, 11675, 9800 and 9610 kHz. Heard in use but not announced was 7400 kHz at 23:30. (Thomas Sundstrom) Radio Kiev was heard with English to North America at 02:00 on 11790 kHz. (Salil Kumar Paul, India)

Towards the end of the year a non-governmental youth radio station, the first of its kind in the Soviet Union will come into operation in Vilnius, Lithuania. Called M-1, the new station will operate on VHF with 4 kilowatts

and the programs will feature much music, live discussions, interviews and reports on youth life. The station is financed by the city of Vilnius, local companies, and youth organisations. (Radio Vilnius via BBC Monitoring)

VATICAN CITY--Vatican Radio's new schedule shows English at 02:00 on 11750 kHz and at 15:00 on 17870 kHz, Hindi at 01:15 on 7125 kHz and at 14:30 on 11955 kHz. (Salil Kumar Paul)

UNOFFICIAL RADIO--"Democracy Broadcasting Station" is a station hostile to the Chinese government and is thought to broadcast from Taiwan. It has been obeserved with 15 minute broadcasts in Standard Chinese on 7125 kHz at 11:40, 13:35, 14:40 and 15:15. (BBC Monitoring)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. Beginning Sept 24, RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
02:30 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21655 kHz (East Africa)
18:00 hrs on 1179, 6065, and 7265 kHz
21:00 hrs on 1179, 9655 and 11705 kHz
23:00 hrs on 1179 kHz
00:00 hrs on 1179 kHz

And to Asia and the Pacific:

12:30 hrs on 15190, 17740, and 21570 kHz
14:00 hrs on 11905 and 17740 kHz
01:00 hrs on 7225 and 9640 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint

material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 33 contributors this week Good Listening!

Since September 24th there is Arabic on Sundays at 05:05-05:30 on 6155, 13730, 15410 and 21490 with a repeat at 19:05-19:30 on 5945, 6155, 12010 and 13730 kHz. (Harry Niebuhr, West Germany, Paul Gager and Manfred Schida, Austria)

BANGLA DESH--The external service of Radio Bangla Desh uses the unannounced frequency of 17978 kHz between 07:00 and 08:00. English at 12:30-13:00 uses the new frequency of 17910 kHz. (S.Anand, India and Don Hosmer, USA in Glenn Hauser's "DX Listening Digest")

BELGIUM--The new English schedule of the BRT is as follows: 00:30 on 9925 kHz, 08:00 on 6035, 11695 and 21815 kHz, at 10:00 on 21810 and 26050 kHz, at 13:30 on 21810 and 21815 kHz, at 16:30 on 17580 and 21810 kHz, at 18:30 on 1512, 5910 and 11695 kHz and at 22:00 on 1512, 5910 and 9925 kHz. (Harry Niebuhr)

French to Europe from RTBF is broadcast as follows: weekdays: 06:30-07:35 on 5965 kHz, 11:00-13:00 and 16:00-16:45 on 9925 kHz. Saturdays: 06:30-07:30

on 5965 kHz, 07:30-13:05 and 16:00-16:45 on 9925 kHz. Sundays: 06:30-07:30 on 5965 kHz and 07:45-16:45 on 9925 kHz. (Francois Chalory, France)

CAPE VERDE ISLANDS--Updating SCDX-2019, three 500 kilowatt commercial shortwave transmitters will be installed soon by the French Company "Media Connection International". The project will be operational in 1991 and it will broadcast commercial programs towards the Americas, Africa, Southern Europe and the Middle East. (AFP New agency via BBC Monitoring)

COSTA RICA--French programs from Adventist World Radio are broadcast daily except Saturdays at 11:00-12:00 on 11870 kHz. (Andre Hemlin, Quebec, Canada)

HONG KONG/TAIWAN--The world's first underwater optical fiber telecommunications system is planned to be built between Hong Kong and Taiwan. The 730 kilometer line will carry data, facsimile and video signals as well as voice communication. It will operate at a rate of 420 Megabits per second. (Vitaly Liberny, USSR)

IVORY COAST--Radiodiffusion Television Ivorienne has drifted away from its nominal frequency of 7215 kHz to 7208. (Thomas Sundstrom, USA)

NETHERLANDS--A couple of changes in Radio Netherlands schedule valid from September 24th: English at 10:30 is on new 9505 kHz and English at 11:30 is on new 21615 kHz. (A. Ghiri and Ajay Kumar, India)

PHILIPPINES--Radio Veritas Asia has moved from 11735 to 11820 kHz for their Tamil and Sinhala broadcast at 00:00-00:55. (Salil Kumar Paul, India)

POLAND--The London Correspondent of PAP news agency learned about a project to build in Warsaw a satellite transmission station which would make it possible for residents of Warsaw and nearby localities to receive BBC World Service 24 hours a day as well as BBC Polish programs to be aired on VHF. (BBC Monitoring)

SYRIA--Radio Damascus broadcasts to Europe in Russian at 17:00-18:00 on 12085. German at 18:05, French at 19:05 and English at 20:05 are on new 9950 and 12085 kHz. (Vitali Liberny and Thomas Sundstrom)

UNITED KINGDOM--BBC World Service has just added two new 250 kW transmitters and four new antennas to its relay base on Ascension Island in the Atlantic. These are to be used for broadcasts to South America in Spanish and Portuguese and to West Africa in English, French, and Hausa. (Reuters, BBC)

USSR--Radio Kiev's new schedule reads: 18:00-18:30 to Europe on 9600, 7240, 7205 and 7150 kHz. At 23:30-24:00 and 02:00-02:30 on 17690, 17665, 15180, 11675, 9800 and 9610 kHz. Heard in use but not announced was 7400 kHz at 23:30. (Thomas Sundstrom) Radio Kiev was heard with English to North America at 02:00 on 11790 kHz. (Salil Kumar Paul, India)

Towards the end of the year a non-governmental youth radio station, the first of its kind in the Soviet Union will come into operation in Vilnius, Lithuania. Called M-1, the new station will operate on VHF with 4 kilowatts and the programs will feature much music, live discussions, interviews and

reports on youth life. The station is financed by the city of Vilnius, local companies, and youth organisations. (Radio Vilnius via BBC Monitoring)

VATICAN CITY--Vatican Radio's new schedule shows English at 02:00 on 11750 kHz and at 15:00 on 17870 kHz, Hindi at 01:15 on 7125 kHz and at 14:30 on 11955 kHz. (Salil Kumar Paul)

UNOFFICIAL RADIO--"Democracy Broadcasting Station" is a station hostile to the Chinese government and is thought to broadcast from Taiwan. It has been obeserved with 15 minute broadcasts in Standard Chinese on 7125 kHz at 11:40, 13:35, 14:40 and 15:15. (BBC Monitoring)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. Beginning Sept 24, RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
02:30 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21655 kHz (East Africa)
18:00 hrs on 1179, 6065, and 7265 kHz
21:00 hrs on 1179, 9655 and 11705 kHz
23:00 hrs on 1179 kHz
00:00 hrs on 1179 kHz

And to Asia and the Pacific:

12:30 hrs on 15190, 17740, and 21570 kHz
14:00 hrs on 11905 and 17740 kHz
01:00 hrs on 7225 and 9640 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are

acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 33 contributors this week Good Listening!

3009. Trying to build a fluxgate magnetometer -- help!

Newsgroup: rec.ham-radio
Date: 1989-10-01 21:49:35 UTC
From: mahaun@sactoh0.UUCP
Message-ID: <1914@sactoh0.UUCP>
Source record: 16534
Cross-posted to: sci.electronics,rec.ham-radio,sci.astro,sci.space

I am trying to build a fluxgate magnetometer sensitive enough to monitor variations in the Earth's magnetic field, mostly to observe magnetic storms caused by big flares on the sun (March 13, 1989 stuff especially :-) !).

I have seen an article about one of these designed to serve as a solid state compass in Radio Electronics magazine's "Hardware Hacker" column, and Radio Shack has also recently come out with a fluxgate compass. Would such a circuit be readily adaptable for my purposes? My main concern is whether it would have enough sensitivity; I would like to measure changes at least as small as 10 gammas (.001 Gauss), and if possible, even smaller.

I envision having a setup with the magnetometer hooked up to a chart recorder and running 24 hours a day. It would alert me to the start of any magnetic storms and would show me the best times to try and observe the northern lights from my location here in California, if there are more *big* flares like this past March (they were actually seen here then, but I wasn't aware of it until a few days later).

I would appreciate hearing from anyone who has built any sort of fluxgate magnetometer, anyone who has seen a construction article for one, or anybody with suggestions/ideas/etc. on the feasibility of this project. Please email to any of the addresses below.

Thanks!

3010. G5RV Antenna Performance

Newsgroup: rec.ham-radio
Date: 1989-10-02 00:28:59 UTC
From: michael@fe2o3.UUCP
Message-ID: <238@fe2o3.UUCP>
Source record: 16535

Does any one out there have much experience with the G5RV antenna?
I installed one this weekend and was very disappointed with the
impeadence match at the end of the coax. This was a commercially
made antenna installed between two trees 20 metres high. The 300 ohm
matching line came straight down with the balun about 4 metres off the
ground. On the low end of 80m the SWR was 2.5 the upper end of 80
about 10 !! The performance on other bands is worse, with 3 the lowest
SWR. 15m is very poor. Of course I can match it using a tuner, but
that is not the point!!
Is this typical for the G5RV or is there a problem I should be
looking for.

I find this to be true on 440 as well, although maybe not as much so as 220
(I don't have a 220 rig, and my scanner doesn't cover it). The only real
obnoxious behavior I have heard has been on repeaters that have links to 2M.

A check through the mail maps that we received on September 29 shows that the original path should work. However, it also shows that "arrlhq" is an IBM PC with UUPC, so I don't know how many people use this machine. :-)

In any case, the mail maps show an administrator of arrlhq!jbloom, also known as Jon Bloom.

Hope this helps.

Msg# TSP Size #Rd Date/Time MsgID From To
5231 BN$ 2748 1 0930/1151 5486_KJ6EO WA4EGT ALL@WB2GTX.NYNET
Sb: Computer Virus: Jail Time & Fines

On November 2, 1988 the great Internet Worm attack disabled
approximately 6,000 UNIX machines across the country.

On July 26, 1989, Robert Morris Jr., a graduate student
at Cornell was indicted by a federal grand jury on a single
felony count of violating the Computer Security Act of 1987.
If convicted, Morrris could spend five (5) years in prison,
and be fined $250,000.

Mr. Morris has also been found guilty of violating Cornell's
Code of Academic Integrity and has been suspended until
the Fall of 1990.

If you know of anyone manufacturing computer viruses, or
that is contemplating them, be sure they're not ignorant
of the potential penalties.

As for the reports on packet that you should be concerned
about BBS systems, etc., hogwash. The virus requires that
you EXECUTE a program containing infected code. Reading
data messages on BBS systems does not run the risk of
acquiring a computer virus. If, on the other hand, you
download some .EXE or .COM program, and run it, all bets
are off. At that point, a program can alter sections of
code in the operating system software (IBMBIOS.COM, IBMDOS.COM
COMMAND.COM, or their equivalent Microsoft files). The two
hidden files (BIOS and DOS) are loaded everytime your system
boots up, and of course the command interpreter is run as well.

You can Unhide your hidden files, and run COMP (file compare)
on your own systems to check for any changes to these operating
system programs, as well as run COMParisons on other EXE or COM
programs if you suspect that one of your programs has been
infected.

If you believe you are the victim of a computer virus program,
it may be possible to trace it back to the author. If the
program has phrases like "Gotcha" or some such, it's possible
to scan EXE and COM files for the phrase (or phrases), find
the original program, figure out where you got it, and work
on its ancestry. Eventually, the source may be found, fined,
```

and jailed.

Good luck.
Jeff.

Well, I don't know about the "official" state of "gamma" vs "nT", but
both are in common usage in "the business." For earth-based mags, the
only unit I have heard used is "gamma".

How many of you circuit dweebs use the "right" term for inverse ohms?
I thought so.

> Next thing we know, there will be legislation banning spectrum analysers.

Gee, that would put a real damper on my workday! And I always thought my HP8562 was a last hedge against ECPA-spawning moronic legislators. :-(

Back when I lived in NY State, I was stopped and harassed several times by cops on account of having a mobile scanner, even though I didn't listen to the cop frequencies (too boring...). I was usually able to calm them by explaining that I was 1) a ham, and 2) a volunteer fireman in the next town. Even so, the anti-radio law in NY bugged me a LOT. It's like too many other vague, capricious, and useless laws which are so sporadically enforced that they function only as tools of harassment.

I was really amused by the posting explaining Swiss law, which evidently must be re-passed every five years: the legilators "are harmlessly tied up renewing a VERY thin book of federal law." I'll bet that would work wonders in the U.S. (and put half the lawyers out of business---a double victory!)

From what i hear, you can expect to wait long periods of time between
6m contacts. At least in the south-east (here) it is a pretty empty
chunk of spectrum. Due to the sun-spot stuff, I am planning on
buying a TS-680S for my truck (HF + 6m) so if you would please let
us netters know how 6m works out, I am interested in your results
for selfish reasons.......the TS-140 is @$200 cheaper......

> close enough to 20 Meters to give similar propagation.
I agree. I have been running 18Mhz mobile for the last 2 months with
100w and have been having a blast. Last weekend while driving north
from the Birmingham area I worked a guy in St. Paul for 75 miles at
interstate speed with no QSB at all. This band is so nice for mobile.

The WARC bands also see alot more traffic when the contests are out.
It seems that the old "rag-chewers" like me flock to the WARC band
haven when the weekly 10-10 200ms QSO contests are beating the
spectrum to death. If you really want to flash-back in time, try
30m CW in the 200w gentleman's limit class. Almost like the old
days.....

Anyone know why 12m is so unpredictable compared to 10m??? Seems
that it should be open more....but then I'm just an Amateur.

3027. TM-731A mod correction

Newsgroup: rec.ham-radio
Date: 1989-10-02 17:59:36 UTC
From: jpd@usl-pc.usl.edu
Message-ID: <1096@usl-pc.usl.edu>
Source record: 16550

The recent posting by VE3EAR was in error with regard to the resistor
to be cut to enable out-of-band receive (and xmit). It should have
named R25 instead of R57. R25 can be found on the bottom side of the
Control Unit circuit card (X53-3250-00 A/3) and is visible and accessible
without removing the card from the front panel. The resistor R125
mentioned is actually a zero-ohm resistor, that is, a jumper.
The cross-band repeater function is enabled by removing R121, as described.
This resistor is zero ohms, and was blue in color without markings.
The modification procedure I have seen says to reset the microprocessor
twice after making these changes.

By the way, did my description of the TM731A firmware bug ever make it
out of USL? If I get enough requests I'll repost it.

Go for it! I'm tire of inviting potential hams over to the shack to listen
to ham radio, only to be embarressed by the jerks on 75 and 20 meters (yes,
I said 20 meters).

I used to consider "self-policing" to be a big-brother synonym for
"ratting on your brother", but I've become convinced that these are
no brothers of mine.

3029. Re: Length of dots and dashes in Morse Code

Newsgroup: rec.ham-radio
Date: 1989-10-02 20:12:09 UTC
From: alanb@hpnmdla.HP.COM
Message-ID: <1250078@hpnmdla.HP.COM>
Source record: 16563

Concerning Morse code spacing:

A dot, with the space following it, is two units long.
A dash is 3 units plus the space for a total of 4.
Therefore a string of dots goes twice as fast as a string of dashes.

Inter-character spacing is 3 spaces.
Inter-word spacing is 7 spaces (units).

The word "PARIS", with the 7-unit space following it, is 50 units long,
which is the definition of a standard "word" in determining words-per-minute.

Well, according to an article somewhere (probably about 3 years ago, and
I don't have any idee what mag, sorry), the *best* performance a rubber
duck would give is '5% effeciency' (referenced to what, I don't remember),
while the 'hot rod' antenna gave 20%, I think. I'll agree that in most
cases, you'll never know you've got a small dummy load on the end
of your radio :-) but there are times a rubber duck makes a good
dummy load and not much else :-) especially in fringe areas.

(ok, I've got my asbestos flamesuit on, go ahead :-)

And I apologize for the lack of reference. Maybe someone has one?

In my experience, the G5RV does NOT give a truly low SWR on all bands -- just low enough to easily match with a tuner. The homebrew one I had years ago was below about 3.0:1 on 80-10 meters, as I recall.

I'll go along with that.

>The time of 1500Z sounds good. Some days I don't hear any signals that
>early - but 10 is a weird band and anything can happen. Let's keep trying
>until 1700Z. That should allow a good chance for catching some signals.

Last Sat. I ran from 1500z to 1830Z, and made one Usenet contact (hi,
Bill, K2IOH!) (but I made 9 total contacts, one with someone running
8 watts in Ohio). I heard a lot of folks on the air talking about usenet
and such, but had failed to tune up my radio correctly so I was only running
about 20 watts and nobody heard me (and I tuned up about 1700z, and most
of the usenet contacts seem to have gone away by then...).

I did have one very frustrating moment when 2 stations, one in NH (I think)
and another in Columbia (as in the nation, NOT the city), were talking, and
I was under the impression that the Columbia station was there first. (This
impression was gained by hearing the Columbian station talking before the
NH person ever came along.) After he got through talking with the NH
station, the NH station took over the freq. asking for anyone wanting
to talk DX to HIM (the stupid NH station). What a jerk! (OOPS, sorry,
my frustration showing there. My first chance to talk to someone out of
the usa (and I'm pretty sure I could have reached him, too) and somebody
steals the freq from the DX station! RATS! but, I digress...)

>And it gives us folks who sleep in on saturday a chance to get up and get on
>the air.

It was pretty interesting to me how the band changed twice during the time
I was on the air. At first it was quite cacaphonous (spelling rotten, sorry)
and everybody was on top of everyone else such that I did not talk to anybody
until 1525Z (Hi, again, Bill). Later (2008Z) it got very quiet and I could
work people with only 8 watts relatively easily. I have yet to hear anything
to the west yet....

>...That'll give me a chance to catch up to Rusty for the W.A.S.

I've only worked two usenet states. Bill (who forgot to give me his
location - I suppose he does not count now?) and Mark WA2ILB, NJ.

>I wonder if the ARRL will take Email QSL's for usenet W.A.S.?

Unlikely, I'm afraid. I've got to get down and get some QSL cards
made RSN...

I am also looking for information on the new Icom IC-2SAT HT. I thought the October issue of QST would have had a product review on this radio, but it does not. Does anyone have any information on this radio yet? If it is as good as the add in the September QST said it is, I would probably buy it for sure. Also, are there any MODS we need to know about?

On another note, I have received my ARRL ballot in the mail.

Source record: 16560

I'd like to replace the tubes in my faithful Hewlett Packard 608D (10MHz-420MHz) signal generator. Many of them are garden variety types (e.g., 12AU7), but a few of the rf strip tubes are pretty strange. Anyone know where I can get (preferably new, but I'm not choosy) types 5675 and 5876 (both triodes with low inductance mounting flanges). If I can't find any at a reasonable price (I've thought of buying a junker just for the tubes, but would prefer new ones) I may just try a solid state modification of the unit as a winter project. Presumably, I could with enough tinkering get MOSFETS to work. Incidentally, if any of you guys haven't ever looked inside one of the old HP signal generators, you've really missed something. They don't build them like that any more. Ahhhh, memories....

>CT map.
>
>Am I missing something?

The ARRL machine is listed in the Massachusetts maps (u.usa.ma.1). The
submitter of the map entry was evecs!lindh, not somebody at the ARRL.

If you want to send email to ARRL, the name of the contact person there
is given as Jon Bloom, arrlhq!jbloom, phone +1 203 666 1541.

The map entry was submitted 1 September 1989, so it's relatively new.

Evecs is in the CT map, so does anybody have any idea at all why arrlhq
would be listed under MA?

I too faced a similar decision about a year ago, and picked the TH-25AT.
Since that time Yaesu and Icom have made some very appealing introductions
(FT-411 & IC-u2GAT) but sounds like your interested in the kenwoods. I
think I picked the 25 because of size, because the 215 has some nice scan
modes and other features not in the 25. But in the long run I think I made
the right decision because the small size is of constant benefit (I take the
radio with me almost everywhere, including backpacking, biking etc.), whereas
I use the scanning function rarely. Here's a summary of my impressions based
on a years use:

Negative points-
* speaker/mic jack needed resoldering (a common defect that may have been
fixed).
* running off external power require purchasing an adaptor.
* batteries must be removed to be recharged.

Positive points-
* good ergonomics. I prefer controls on top.
* batteries last long time.
* rugged construction.
* nice styling, rubber buttons, good display.
* good signal reports.

Recommended options-
* extra battery
* DC adaptor (you don't need the cord, you buy the connectors at Radio Shack).
* Speaker Mic
* Larson Kulduckie antenna, or Kenwood telescopic
(stock duckie is a duckling :-)

Good luck on your purchase !

So, I understand that some of the fine foke on Usenet are attempting to set up an on-the-air "net" on weekends. Well, if you'd like to avoid re-inventing the wheel, de gang on the Fidonet HAM RADIO Echo are just getting something solid started with a Net. This past Sunday (10/1/89) we actually had a couple of actual, real live checkins!

Why not join us every Sunday at 1615 and 2215 UTC on 28.4 MHz, + or - a few kHz if there's QRM...I betcha we can build up a pretty nifty group, and we get users from Asia, Australia, etc., whilst you here have participants from England, etc. If the band's open, we could be nearly worldwide (gray line permitting)!

GET IN ON THE FUN...BE LISTEINING FER YA THIS SUNDAY!!

That's not the only virtue of the Swiss system of government. Another is that the executive branch is run by a group of commissioners (like a cabinet) who take turns every 12 months being President. The best of all is that virtually all questions of any real importance are decided by the voters at regular referenda.

3041. Advanced HyperCard Ham Stack now available

Newsgroup: rec.ham-radio
Date: 1989-10-03 13:10:00 UTC
From: dls@genrad.com
Message-ID: <26903@genrad.UUCP>
Source record: 16485

I have finally got the Advanced Ham Stack (for use with MacIntosh HyperCard) typed in, and I've been using it for 4 days. I'm still catching typos.... and fixing them as I catch them.....but it basically works as it should.

This Ham Stack is about twice the size of the previous three (Novice, Technician and General)....also has twice as many questions, so I don't find that surprising.

There is a lot more mathematics involved in the Advanced test, so the Mac Calculator is no longer sufficient to take the test....you really need a scientific calculator...unless you just want to MEMORIZE the answers....which I don't recommend. I find that the only functions required are inverse tangent, cosine, square and square root, 10**x (which is same as log-1), pi, and exponents. The equivalent Thevenin circuit questions I have no difficulty doing in my head, so I don't use the calculator for those.

If you're interested in this stack OR any of the previous three, just email
^^
to me, and I'll send a diskette to you. Please state ORDER OF PREFERENCE
^^
for the stacks, since if they don't all fit on a diskette, I'll only send two or three of the four. I do have files called Stuffit/UnStuffit, so I may use that to condense the sizes....but ONLY after I pay the owner of Stuffit for the use of his shareware. UnStuffit is free, so I guess I could send that on the same diskette.....I don't yet know whether it will save enough space...I haven't tried it yet.

Alternately, Peter Hayward will soon be receiving the latest upgrades and the Advanced Ham Stack and I believe he intends to make it available via anonymous ftp at tank.uchicago.edu. Files are in (or will be in) /pub/public.

Here is my "Advanced Cheat Sheet" of formulas for the Advanced test, for use in PRACTICING with the Ham Stacks (Remember, ya gotta memorize these for the real test):

Advanced Cheat Sheet

Reactance XL = 2(pi)fL XC = 1 / (2(pi) fC)

Resonant freq fr = 1 / (2(pi) sqrt(LC))
L = 1 / ((2(pi) fr)**2 C) C = 1 / ((2(pi) fr)**2 L)

1/2 Power bandwidth delta f = fr / Q
Series Q = XL / R Parallel Q = R / XL

Phase angle x = tan-1 (X / R), where X = XL - XC

Power factor Preal / Papparant = cos phase angle

Effective radiated power Peffpwr = log-1 (dB / 10) x Poutput

Modulation index = fdeviation / fmodulation

Antenna efficiency = Rradiation / Rtotal * 100%

Physical length of coax L(m) = 300 V / f (MHz), V = .66 for coax

Plate load R of amplifier RL = Vp / (K Ip)
K = 1.3 for class A, 1.5 for class AB, 1.57 for class B, 2 for class C

WALT,
This HAS become a problem. The problem is that the HOSSTRADER organizers
tell us one thing, but actually DO something else. Why is that? This spring
people started showing up at 8:00 am. Don't the owners lock the grounds ?
Almost every time we hear of the 4 PM opening we hear the same stories
of people in before noon, set up and selling. I fully respect the right
of the organizers to close the area to everyone till a given opening time.
BUT if they are going to talk about it please do it. Just don't give us
conflicting stories. I like to get the deals like everyone else. I hate
showing up after 4 just to be told that "you should have been here around
noon"!
BTW Please thank Joe and his crew for doing a great job with the flea
market. We all deeply appreciate it !!!!

C U around noon ??
73

Rusty,
I won't flame you (:>) but I will refer you to Sections 3-7 and 3-8 of 'Antennas' By John Kraus (W8JK), McGraw Hill 1950. Sorry I don't have the newer edition but I'm sure that antenna theory in this area has stayed the same. (:>).
What this indicates is that the aperture of a short dipole is at most about 10% less than that of a full size dipole. Since aperture and directivity/gain are directly related you can treat that as about a .5 B reduction in gain if you want. A problem that short dipoles (and monopoles) do have is that the radiation resistance gets pretty low when they get short. This means you have to have a very high Q matching network to get a significant amount of the transmitter power into the thing. It's pretty easy to burn 99% of your output in the matching network on a very short antenna but, if its any consolation, the power that does get radiated has about the same pattern as a full size dipole. On receive one can sometimes put a very high impedance follower on a short antenna and "match" that way. Sort of "to heck with the SWR, there won't be any current to lose signal in anyway".
The short whip followed by a MOSFET is a common apartment dwellers broadband HF antenna. I think MFJ sells one like that. As another example, I think WWVB at 60 KHz transmits into a 200' top loaded tower or something close to that. This thing is terribly short and I seem to remember that they get well under 1% of their transmit power radiated. It seems to me that the matching network was something you could walk around inside.
Anyway, helical or not, short dipoles and monopoles do have very nearly the same gain as as full size dipole but they are tough to feed efficiently especially when they get very short. I don't know the typical numbers, but I doubt that typical rubber duckies are too far down from full size whips. Usually they are at least 25% of full length anyway. Maybe someone on the net has done some experiments and can report.

I'm planning to purchase Radio Shack's $70 discone antenna for my PRO-2004.

It is supposed to cover 25Mhz to 1300Mhz.

Does anyone have any experience with this antenna?

Is there another company that makes a better general coverage antenna for
the same price?

Please reply via Email (if possible) and I'll post a summary.

car.

>model rockets that he uses. It works fine but he would like to
>make sure he is getting the best possible range per ounce of
>transmitter payload. Please email any responses. Thanks!

Well, the good ol' ARRL Antenna Handbook is still probably the best introduction to the subject for a beginner, without getting into the fairly heavy-duty math of serious antenna theory/design. However, I think that I can provide some additional help in this particular case.

The problem your friend's facing is one of providing the strongest signal AND an omnidirectional pattern, with an antenna which I assume must be kept as small and as light-weight as possible. (By the way, knowing the intended frequency of operation would help a LOT. For this application, you really want to be in the VHF or UHF range.)

If an antenna is properly "matched" to the transmitter, such that we can assume that all of the power makes it into the antenna, then the only way to provide actual "gain" is to make the antenna directional; that is, to squirt more of the signal in one direction, at the expense of having less power radiated in others. This is the principle behind "gain" antennas such as the Yagi beam or the log-periodic (which actually is a compromise between gain and a wide bandwidth). Omnidirectional antennas MUST (to qualify for the name!) radiate equally well in all directions, and there's only so much signal available to begin with. This sets a limit on the signal power which can be radiated in a given direction.

BUT, you say, what about these "omnidirectional" antennas which claim "gain of Xdb over a quarter-wave whip" (which is itself an omnidirectional antenna)? Well, consider that the radiation pattern acutally extends in three dimensions, not two. If a perfect "isotropic", or "point" source were possible, it would radiated equally well in ANY direction - in other words, a plot of equal-signal-strength points would be a sphere. Real antennas - such as vertical whips - do not do this, but instead have a radiation pattern which is roughly toroidal. The "flatter" the toroid, the greater the signal strength in that *plane*, at the expense of signal strength in other directions. The usual means of getting the pattern "flatter" (besides moving the antenna up away from the ground) is to make it *longer*, and thus a 5/8 wave vertical antenna can be said to have "gain" (toward the horizon!) over the shorter quarter-wave whip.

For a model-rocket based transmitter, though, we have the restriction of having to keep the antenna short and light, plus we cannot count on any particular orientation with respect to the ground-based receiver. A small whip antenna is probably the best that can be done here, and likely this will

take the form of a helically-wound whip (or "rubber duckie") for size and ruggedness reasons. The key, then, is to provide the best possible *receiving* antenna; if you have someone to track to rocket, a dish antenna provides tons of gain, but a narrow "beamwidth" - you've got to aim it pretty well. A good choice might be a small Yagi on a hand-held mount; check the amateur radio handbooks for suitable designs for the VHF frequencies. (And again, exactly WHAT frequency did you have in mind? Gentle reminder: are you *licensed* to use the frequency in question?)

Good luck!

With names like Short-circuit, Gray Ghost, Ghost Rider, Hoser, Preacher and Strider you would think that one was talking to C.B. radio operators. Well you would be right and some of these names were members of a Boy Scout troop on a camp-out.

Hoser and I were in town talking with Gray Ghost who was out at Suger Loaf Mountain with the Boy Scouts, just chewing the fat when Gray Ghost said he could see a fire just off the south west slope of the mountian. I asked him are you sure about this and he affirmed this and asked if I would place a call to Centeral Dispatch. While I did this he told me where the fire was located, the size, wind direction, and movement of the fire. I relayed this information to Centeral.

Centeral was then able to relay this information to the Marquette Fire department. It was amazing the way this infomation was passed along. As I also have a scanner at the home twenty I was able to follow the progress.

The people (on the C.B.) handling this traffic one must remember are not people do this on all the time. In fact most times the people that use this form of communication do so just for fun.

This type of thing happens from time to time and shows that as much as certain people think of C.B. operators as not worthy of any band width, there are people that operate the 11 meter band who do try to use it for enjoyment. And when something like this happens are more than willing to help out.

Message-ID: <8910041817.AA21363@ucbvax.Berkeley.EDU>
Source record: 16566

Why don't the ELT's transmit some sort of ID code instead of just a tone or carrier or whatever it is they transmit now? Something that would be set by internal jumpers or diodes wouldn't up the cost all that much over whatever they cost now. That way the aviation ones could send the aircraft "N-number" (or the equivalent for a non-US plane); the marine ones could send the boat's radio callsign or license number or something like that, and then ones *could* be used by backpackers and other terrestrials with a special code prefix that would identify them as walkers, vehicles, etc. Could probably even get down to Scout Troop number or other such ID's.

That appears as if it would make the whole system more useful at not much increase in cost, and it would fix some of the problems that have been described in this discussion.

Probably an island off the I8 area of Italy, of interest only to the "Islands -On-The-Air" freaks. The ARRL Operating Manual map of Italy (p. 17-28) shows an island with the prefix IC8 but no IF8.

It's easy to create the impression of something important by just getting on the air and sending your fastest CW, giving everyone 599 - the DX world will beat a path to your door. OK, so I worked them too (0238) just in case they later turned out to be interesting :-) QSL via IK8BQE...

Among the 200 QSOs I had before I got my present call was one with an Italian station signing /IH9. It was only when I got a QSL card from the bureau two years later that I realized that it counts as Africa for the WAC award. I had not worked any "real" Africans with that call, but by working this guy I did finally qualify for a WAC with that call, allowing me to "include the letters W.A.C. on my station cards and correspondence". You don't get a thrill like that every day :-)

So, send him a card, he'll appreciate it, and you never know, one day you might become an IOTA freak and be really glad you worked it....

Regarding the IC2 and IC3-SAT's. I have both and they are terrific. They operate well on both transmit and receive and have more goodies buried in them than I have time to play with!

The complaints I have are minor. First, there is a bottom cap which covers the terminals on the bottom of the radio when external batteries are not attached. I wish ICOM had made a provision for storing that cap when a battery is attached (at least there is none on the BP-86). The second is that the radio gets *very* hot when operated at 5 watts. Hot enough that you can transmit for about a minute before it becomes uncomfortable.

I've used the radios while traveling, for portable packet, and for general use. I can heartily recommend them.

>toto@tank.uchicago.edu

A marine radio requires a Restricted Class Radiotelephone License.
Your best bet is to write your local FCC field office (see Federal Govt.
listings in phone book) and request the application form.

Note that marine radios are for use only when in a vessel and not for
land communication usage. Typical call interchange is to state the vessel
name and license call letters. You should become familiar with marine
radio usage/frequencies before getting on the air (you wouldn't want to
"stumble" on an emergency frequency. Also, calling a local marine electronics
business may give you additional information.

'Happy chumming...

G5RV himself gives a nice discussion of the antenna in the ARRL
Antenna Compendium. Worthwhile reading. A couple of points out
of it are that a tuner IS necessary, and a balun may NOT be desirable.
I am told that ferite baluns are well behaved in a 50 ohm system, but
that all bets for loss are off when you get away from 50 ohms; and
as you noted, the bottom of the twin lead is not 50 ohms!

I use a tuner with mine, and it seems to work ok. First contact
on a little HW-8 I fixed up was New York for 30 min on 20M, so I
guess its getting out.

Look up that article, its good reading. 73's

From: tad@ssc.UUCP
Message-ID: <213@ssc.UUCP>
Source record: 16491

In response to the question about lousy G5RV performance, the best way to feed it is with open wire or twinlead all the way to the antenna tuner in the shack. The tuner should have a balanced output. Even G5RV himself says this is the best way to feed it, and that if you do it this way the element length is non-critical. What he was trying to do with the matching section and odd length was to get something that COULD be matched on most bands.

When you feed it as I described, you really end up with the classic multi-band doublet that the ARRL has been describing in books for years.

N7ZZ asked me to post this:

SB DXERS @ ALLUSA $N7ZZ0929
PTI, Another New One!

Puyallup Tribe of Indians
Application for New Country Status

9/29/89

A group of Northwest amateurs, including N7ZZ, W7EJ, W7ZR, K7SS, K7RA, KE7V, N0AX and others will operate from the Puyallup Tribe of Indians land (PTI) on the weekend of October 13 using their individual calls /PTI. They are applying for separate country status under Rule 1, Government, under the current DXCC rules. See April 1988 QST for complete DXCC rules.

The Puyallup Tribe of Indians land qualifies under the definition of sovereignty, and supporting arguments for the criteria have been discussed with DXAC, ARRL officials, and others. This one stands a good chance of qualifying.

It is located near Tacoma, Washington.

Operation will take place on all bands on recognized DXpedition frequencies. Special commemorative QSLs will be handled via SASE to the callbook addresse of each operator.

73,

Stu
N7ZZ @ K7IFG

I used a discone from Radio Shack for a while this summer before coming to the university here. Although it was borrowed, it seemed to work great. The only thing I have to say is I DON'T like the price. Also, you can get a carbon copy of it from icom, etc. I also heard it's 0db gain (which is contrary to my understanding of how it works, IMHO). I think that, if you can, make or buy a dipole or a 1/4 wave. It'll probably cost less and you'll get the same performance. But if you want to stick to RS, then that's the only way to go. All I have to say is that it works, but I think it's too much $ to spend for what it does. 73's!!

From: alan@km4ba.UUCP
Message-ID: <233@km4ba.UUCP>
Source record: 16495

From what I have read & measured, the g5rv is a resonant antenna, but not necesarily a 50 ohm match. (The figure 200 ohms for 10 & 15 meters comes to mind)

For solid state rigs, tuners are a must but some tube finals can match it.

My TS-440 matches & radiates much better on the g5rv then non resonant antennas. (I will define resonance as when the inductive & capacitive portions of impedance are equal & opposite) The opposite extreme of this is an hf mobile antenna, which can be set up for an 50 ohm load, but has mucho inductive reactance. Power is lost due to I**2 * R losses. Also tuners have a more difficult time.

My choice:

G5RV with tuners for every day / multi band ops....
cut & trap dipoles or multi band vert for specific bands/conditions, used in band segments where they are resonant & a good 50 ohm match.
(at least until I get the KT-34XV 6 ele. tri-band up that is laying in pieces in my back yard)

The instructions that came with my g5rv did a pretty good job of explaining the above, so you may want to look in your instructions.

Hello All,

I am looking for information on world-wide HF packet gateways and BBSs.

I would be grateful if anyone could give me details (QRG & QTH etc) of
such boxes in US and Canada.

I'll summarise and pass on to others.

A friend of mine bought the VCP200 Voice Recognizer Chip for me.
Unfortunately, the Data sheet and applications note that Radio-Shack
includes in the package was missing.
A letter to the Forth Worth HQ resulted useless, so maybe someone out
there could help me by sending some data on the chip. I'll gladly
refund the AIR MAIL charge.
Thanks ! 73's David Prutchi HC1DT/4X

True as far as it goes, however if you run a terminal program which has ansi escape sequences (or vt100 emulation or some other such thing), jerks can still do bad things to your computer. Have you heard of the 'christmas card bomb' which was a bunch of text you displayed on your screen and which would use some 'nifty' :-(escape sequences and operating system commands to attempt to delete all files on your system. True, it was computer and OS specific, but those people having the computer for which the bomb was designed lost their files.

Of course, if you are using a terminal emulator, turning off ansi (and other such emulation modes) should keep you safe.

If you are running an IBM (or compatible) computer, it would be wise to (1) back up your computer prior to Friday the 13th (Ahh, you forgot we have a friday the 13 coming up next week? We do), (2) get a virus scanner or two and run them just to be 'sure' (is there any such thing?) you are clean, (3) perhaps subscribing to comp.virus where you get the latest news of viruses would not be a bad idea, (4) don't panic, its probably not quite as bad as the anti-virus screamers would like you to think, but then if you get hit by a destructive virus it would be better to be prepared and watchful than blissfully ignorant until your data went away.... So be prepared and don't panic.

Disclaimer - the above information is second-hand and probably has some inaccuracies in it. Your mileage may vary. Poster not responsible for bombs, trojans, or viruses which get loose on your system. (Add more disclaimers here)

For good, solid info on viruses, bombs, trojans, and the like, check out the newsgroup comp.viruses (which is where I heard about the 'christmas card bomb').

'nuff for now. Don't panic. But do backup data, its a good
habit anyhow!

I had a chance to get my hands on a ICOM R-9000. I was impressed. On a side by side comparison tests it out-heard the R7000. Signals that were not hearable on the 7000 were weak but Q5 copy on the 9000. Also watching TV on the built-in amber monitor was pretty strange :-). 1000 memories with the ability to scroll through and add info on each should alleviate the need for freq lists.

Also, on another note I received some literature from WI-COMM ELECTRONICS on their new MAST MOUNTED wide band (10 MHz-900 MHz) pre-amp. The numbers (NF, IP3, 1dB comp) look good. Has anyone out there used any of their products ?

3074. Reply to Chris's query about the R-S Discone...

Newsgroup: rec.ham-radio
Date: 1989-10-04 15:16:12 UTC
From: rlwest@flopn2.csc.ti.com
Message-ID: <8910041536.AA10211@ti.com>
Source record: 16514

Chris:

I have been using the RS Discone for about two weeks on Packet. It seems to work, as advertised. I plan to use it for 2-meter coverage of a walk-a-thon in a couple of weeks. The walkathon might be making use of both 144 and 440 frequencies, so that antenna with my dual bander, seemed like a natural.

The commercial sources for discone antennas other than Radio Shack is PROCOMM, Thousand Oaks CA. It sells for about $100 and has or can have a 10-meter whip on top. It was reviewed in 73 Magazine in April by Jim Gray W1XU and Peter Pederson W7KTK.

The advantage I see is that it *is* wideband :> while the disadvantage is no gain :< (uh oh! LOGIC ALERT! "No Pain, No Gain!" IS THIS A PAINLESS ANTENNA?)

I will gladly let you know what the performance is after the walkathon. In the meantime, I like the little critter. Looks like something out of "LOST IN SPACE"... Seriously, I think the FAA and NOAA have been using discones for years. Hey, if it's good enuf for them...

Good luck with your research. I was so overwhelmed at seeing such a useful item at my local RS that was only slightly exorbitant in price, I went ahead and bought one. I guess I'm a sucker for a bargain?

73, and please do post your results and conclusions. I will post this as well as sending it direct to you.

From: MBramwel@business.uwo.CA
Message-ID: <8910041616.AA20466@julian.uwo.ca>
Source record: 16513

If you are having difficulties getting into the server, you can try anyone of these addresses:

bitlib @ business.uwo.ca .ca .cdn & .bitnet are all
business.uwo.cdn acknowledged by our system
uwovax.uwo.ca
uwo.ca
uwovax.uwo.bitnet

Our mail system will re-route requests for bitlib to the proper id once it has made it onto campus.

Also, just because you made it to bitlib, does not mean that bitlib can reply to you. Lately I have been getting alot of usenet mail bounced back to bitlib.

If you reply address is different than your address in the FROM: line of the header, please make the first line in your message a new FROM: line
EXAMPLE:

FROM: jdoe@central.yalevm.bitnet

If after a few days of no response, you can try the following:

FROM: HAMRADIO

This tells the server to post the response to the INFO-HAMS digest!
Since everyone can read the digest, you will eventually receive the reply.
INFO-HAMS and REC.HAM-RADIO seem to be the same thing (gatewayed <>)
Please don't post numerous files to INFO-HAMS using this method else it might get messy(nasty) on the net.

de VE3PZR, Mark in London.

KENWOOD TS-440

West,Gordon: "Kenwood 440 Modifications" _Popular Communica-
tions_, October 1987 p. 62.

Illustration captions:

1. Remove 17 screws holding on the bottom and top covers. The bottom
cover comes off, and the top cover is carefully removed and put next
to the radio. It is till connected via the speaker wire.

2. Gain access to the front of the unit by removing two top side
screws and loosening two bottom side screws. This allows the front
assembly to swing open.

3. Remove the shiny silver control board protection plate. This
requires removing two screws on the top and three screws on the
bottom. Lift the plate out completely.

4. Locate diode D-80 in the bottom left-hand corner. Snip it for
all-band transmit.

5. Now locate D-66 and snip. It adds 10 Hertz readout to your
digital frequency display.

6. Carefully reassemble the control plate using a magnetized tiny
screwdriver to hold the five tiny screws in place. Don't pinch any
wires. Also, close up the front and replace the top and bottom covers
with 17 screws.

7. Connect power. Depress A=B switch and turn on the power
simultaneously. This resets the microprocessor for all-band transmit
and 10 Hz frequency display.

This article also tells how to increase the power of the TS-440 by
adjusting the internal ALC control. The procedure is applicable to
other rigs.

Source record: 16505

/ hpfcdq:rec.ham-radio / car@trux.UUCP (Chris Rende) / 9:26 am Oct 3, 1989 /
I'm planning to purchase Radio Shack's $70 discone antenna for my PRO-2004.

It is supposed to cover 25Mhz to 1300Mhz.

Does anyone have any experience with this antenna?

Is there another company that makes a better general coverage antenna for
the same price?

Please reply via Email (if possible) and I'll post a summary.

car.

trux!car@uunet.uu.net Minix,PC/XT,Mac+,TRS-80 Model I: Buy Sell Trade
"I don't ever remember forgetting anything." - Chris Rende

I purchased one last February and have used it on a 25ft pole for general
scanner monitoring and some 2 meter packet and phone work. It doesn't
have any gain but with a little elevation it works fine. I could hear lots
from the Denver area (60 miles south). On packet I could read stations all
over the Colorado front range area. My only regret is that I didn't purchase
it sooner.

On the negative side: I'm moving and took the antenna down last night. Some
of the elements are showing some stress from the wind and are starting to
bend. It also had a big spider that was upset at having "home" dismantled.

Body handling: HTML body converted to readable text

Well, not really. The discone should be used for its properties, which are: extremely wide bandwidth, relatively small size, and omnidirectionality. A dipole or a quarter-wave will have very narrow bandwidth. When used outside that bandwidth, the dipole will be ineffective, and the coax will act as a giant whip antenna, and will perform very poorly on frequencies for which it is a multiple of 1/2 wavelength.

I own the RatShack discone. It is essentially the same as the Icom one, but about $40 cheaper. I hated to spend $70 for it, but I understood what I was buying and am fairly satisfied. To use it to its fullest extent (> 450MHz), you will need expensive coax.

TNSTAFL -- all antenna designs must trade-off directionality, bandwidth, gain, and physical size. A discone design is ideal for scanners because it covers more than a 10:1 frequency range, and can be used both for the county mounty on 37 MHz and CMT on 850 MHz. Using anything else for such a range is probably no better than simply making a whip antenna the same length as the coax you would use!

3080. Re: PTI New Country Status

Newsgroup: rec.ham-radio
Date: 1989-10-04 17:31:15 UTC
From: rkarlqu@hpscdc.HP.COM
Message-ID: <5490066@hpscdc.HP.COM>
Source record: 16506

I can think of a number of arguments against this being
a separate country:

1. This is the same Indian tribe that used to sell illegal
fireworks on the reservation. If they are really sovereign,
then this should still be taking place with the blessing
of the courts. Also, untaxed liquor sales and bingo games
(why not casino gambling) ought to be fine too. I moved
out of Seattle 15 years ago, but I bet they don't even
sell fireworks anymore.

2. If any Indian "nation" really is a nation, the Navajo's
are. Yet, they have a 50,000 watt AM broadcast station
(the voice of the Navajo nation, or something) which uses
FCC assigned call letters (K-something). Hence ham radio
on their reservation would also be administered by FCC.

3. Yes, there is rule #1 (sovereignty) but there is also
a exception to this (rule #3 or 4?). The exception rules
out "extra-legal" territories, including *but not limited to*
embassies, monuments, etc. This would seem to include reservations.

Disclaimer: I have nothing personal against Indians or
K7ZZ and the Western Washington DX Club, of which I used
to be a member (ex-WA7VZX). I just hate to see DXCC
watered down.

Thanks for all the informative replies to my posting for info.

One more question......Since you must work only QRP for the 5x multiplier....does the Novice station have to work QRP only also?? Since it does not count as another xmitter, it was unclear....

Also, on the subject of solar power, I saw in the Edmund's Scientific catalog a portable 12vdc solar pack. It had solar array, battery, charging circuit and all in one little case. The 12.5A version was over $400.00!! Is there a cheaper solar source?? It seems awfully expensive to me (but solar is not in my bagg). Since the Alabama/Tenn area here has such nice mountains and streams/rivers....I was leaning towards car alternators with paddle-wheels in a wooden frame to just set in the stream for charging batteries. Any other discussions on alternative power sources would be most interesting to me (and a breather from pizza-patch/14.313 topics).

Goin' for it on FD..........de KM4JN

From: jwivoda@umn-d-ub.D.UMN.EDU
Message-ID: <2871@umn-d-ub.D.UMN.EDU>
Source record: 16500

I have been confused about the scanning feature on the TS-440S. The manual says you can scan all the programed memories by pressing "scan" while in memory mode. It does scan, but not ALL the memories; it scans only the last 10 memory group that you did scan. I tried resetting the radio and it does work after that, but after I scan a group, it will only scan the last group "scanned".

HELP! Jay KA0CMU

3085. Re: ELTs (was selling radios to the unwashed...)

Newsgroup: rec.ham-radio
Date: 1989-10-04 21:08:13 UTC
From: bmp@hpcupt1.HP.COM
Message-ID: <7120082@hpcupt1.HP.COM>
Source record: 16512

The newer ELTs do just that. Arnav manufactured an ELT called
and ELS or ALS, which, when coupled to a loran would transmit
tail number and last known lat and long modulated onto the
signal. The aircraft we had with one had an incident, and
the avionics set got reassigned so I can't play with it
any more.

There is a new set of standards for ELT's which will soon be
in force that will affect newly manufactured ELT's. They
will also transmit on 406 Mhz. and have some sort of
a signature that makes them more identifiable. Maybe someone
who follows the TSO's for ELT's knows more than I can fill us
in.

Our CAP group once got launched to chase an ELT that turned out
to be our aircraft with the ELS merrily telling the world who
it was and where it was. We were rather embarassed and the
shut down checklist got modified.

In article <837@lopez.UUCP> preacher@lopez.UUCP (Preacher) writes:
(a heart warming story about some C.B.ers helping put out a fire...)
+
+This type of thing happens from time to time and shows that as much as
+certain people think of C.B. operators as not worthy of any band
+width, there are people that operate the 11 meter band who do try to
+use it for enjoyment. And when something like this happens are more
+than willing to help out.

To you and your public minded friends: Bravo! Nice bit of work. But you must consider how few instances of such happenings are commonplace in the Class D Service. Now think about the millions of inconsiderate operators that make up the majority of the C.B. users and I think you'll understand why both the FCC and the Amateur community are quite against ANY expansion of the Class D CB Service. If people had to have a license, and hence were bound to follow the rules (as laid out in Part 95) C.B. would be a lot more useful, especially in heavy population areas and the Urban-Metros like Los Angeles, N.Y., etc.

It is unfortunate that the deregulation moves in Washington D.C. cut the FCC enforcement budget, I'm sure that you would agree, 11 meters would be even better if the FCC had enough $$ to eliminate the bad-actors. But given that this cannot be done, the next best alternative is to simply "contain" the problem; i.e. no increase in allocation, no new modes (like FM or packet), and no help in regulating the use or activity. This means that no longer will your fellow CBers be citizens, they may not even speak English! Hell! THEY MAY JUST BE SOUTH-AMERICAN COCAINE DEALERS!
The FCC has decided that Class D Service will have to survive or fail on it's own. If this means choking on it's own swill -- so be it. There are no funds to do anything else. If CBers were serious about getting a bigger allocation it would behoove them to push the Government for better policing of Part 95 violations, and the reinstituion of licensing. Period.

You (and your youthful commarades) might consider joining the ranks of the Amateur community, it's just such people as yourselves that can benefit the Public Service aspects of this hobby the most...and that's the long and short of it. '73!

Some do. ARNAV Systems has an ELT in their product line
that will voice the aircraft ID *and* the latitude and
longitude as read from the Loran. Makes search and rescue
a lot easier, not to say anything of the ease of finding
false alarm ELT activations.

Could someone check with ARRL HQ, and see what they're willing to receive mail about, and reply to. It doesn't to any good to send mail if the right person won't read it. Maybe some of them could be dragged into 1989.

Also, does anyone have the 26-28 MHz mod for the HR2510? I got one, and I'm burning with curiosity to see if the mod would take. Please let me get out of this misery.

Has anyone heard of any mods for the IC4SAT? They make an E version that covers 430-440, and I'd like to be able to access 430 to 450. My IC32 will, now that it's been modified.

And finally, I've seen a 'phone number for a Kenwood BBS run by Kenwood, somewhere, either here, or on packet. Does anyone have that number?
thanx, and 73

o ARRL Files for Code-Free Ham Class!

"The League has carefully researched and evaluated this subject. It is not one which yet enjoys universal acceptance in the amateur radio community. It is, however, one which the League now supports as beneficial to the future, short and long term, of the Amateur Radio Service. The only way the plan can fail is if the Amateur Service rejects the Communicator class licensees as full-fledged members. This the League firmly believes will not occur, as the Amateur Service has a tradition of mutual assistance, and guidance of newcomers by the more experienced members. Newcomers will strengthen the Service. Once and for all, those who have a true interest in becoming radio amateurs will have the opportunity to join, unfettered by unfounded perceptions about entry barriers. They will not only have the opportunity to become amateurs, but will also have a more favorable exposure to the benefits of having a personal, cognitive communications skill, which is shared worldwide in the Amateur Radio Service. The learning of Morse code should be viewed more as an opportunity than as a burden, or a hurdle over which they must jump." (Excerpt from ARRL Petition for Rulemaking)

As expected, the American Radio Relay League submitted a Petition for Rule Making to the Federal Communications Commission on August 31 seeking "Establishment of a Class of Amateur Radio Operator License Not Requiring a Demonstration of Proficiency in the International Morse Code."

The League proposed a new sixth class Communicator license offering specific, limited privileges on amateur frequencies above 220 MHz. There was no mention that these privileges would actually be above 222 MHz since the FCC reallocated 220-222 MHz to the Land Mobile Service.

The filing came a little more than a month after League officials, meeting at their July board meeting, voted to seek a ham ass which did not require knowledge of Morse code. The vote was not overwhelming in favor of a code-free ham class. Nine directors were in favor; six opposed.

The Board not only considered the views of its members but also the recommendations of a special study committee which for months had gathered information on the subject and rendered a comprehensive report (See 4/15/89 W5YI Report). That Committee was comprised of representatives of the Amateur Radio industry, League elected representatives and individual amateurs. They reached four basic conclusions:

(1.) there is a perception that the code proficiency element of the amateur entry level examination is a significant barrier;

(2.) ...the code proficiency requirement does not act as an appropriate filter to weed out undesirables;

(3.) ...there are many good reasons for maintaining code proficiency;

(4.) ...there is nothing antiquated or irrelevant about the code "but this is a matter that some individuals must learn for themselves, in order to appreciate the relevance."

The Board adopted a lightly more conservative proposal than the Committee recommended. The League said the changes reflected the input received from the amateur community. It appeared overall that the attitude of amateurs was significantly more favorable toward a codeless amateur license than in 1983.

The well researched and prepared petition was authored by League attorney Chris Imlay, N3AKD, and comprises some 25 typewritten pages. It also contained a very interesting history of the no-code ham movement in the United States.

The Communicator Class

The ARRL maintains that the Communicator class ticket is not an entry-level license in the same sense as the Novice class license. Earning the new codeless license would require the applicant to pass a written examination somewhat more comprehensive than the present Technician class theory examination, including some questions relating to Morse Code, but without a Morse receiving, sending or recognition requirement. The code questions would be on the tradition and utility of the Morse code.

Three accredited volunteer examiners from the VEC System would administer the examination, and upgrading to a Technician class of license similarly would involve taking a five-word-per-minute code examination similarly administered. "The need for absolute security, and the perception of the same, is critical not only to the success of the program in fact, but also to its acceptance among present licensed amateurs. The amateur community must be convinced that the new licensees obtain their licenses through a highly monitored, publicly administered examination program, in order that it avoid and be perceived to avoid, compromise. The license carries with it privileges not available to Novice licensees, and as such is properly included in the VEC program."

"There should be an upgrade path from the Communicator class of license to the present Technician license by way of a five-word-per-minute Morse code examination element, administered through the established Volunteer Examiner system> The petition clearly states that all Communicator and Novice licensees would have to be retested under the VEC program at 5 WPM code before they could qualify for a Technician ticket.

"No credit for element 1(A) shall be afforded those seeking a Technician class operator license on or after the effective date of the Communicator class operator license by virtue of the possession of an unexpired license which incorporates that element." It will be interesting to see what Novice level and VEC System examiners think of that proposal.

ARRL said Communicator applicants would be required to pass the current 30 question Novice written test element 2 and a beefed up 30 question Technician element 3(A) written examination to obtain a Communicator license. The present element 3(A) contains 25 questions. The additional five questions would be on: Amateur digital communications techniques (3 questions) and two questions on the use and application of Morse code.

It is unclear if this would require increasing the nine examination topics to eleven to insure their inclusion in written tests or whether these questions could be added to the existing "operating procedures" and/or "signals and emissions" subelements. Specific questions merely added to existing subelement pools need not be asked in all examinations.

Communicator privileges would be all amateur frequencies and authorized modes above 220 MHz, at a maximum output power of 250 watts. "There is a perception that the VHF bands below 220 MHz are overcrowded, or are otherwise inappropriate for Communicator use. The League ascertained that there exists a great deal of acceptance of a code-less amateur license if the privileges were limited, as proposed, to frequencies above 220 MHz."

The ARRL also believes "...there should be a strong incentive (such as the attainment of 2 meter privileges) for codeless licensees to upgrade their license class." A Communicator licensee may not be a control operat of a repeater or auxiliary station. With respect to power levels, the League saw no need to permit the Communicator class licensee to operate at greater than 250 watts PEP output, given the frequency bands available. "...greater power can be reserved for higher-class licensees, so as to create the incentive to upgrade."

Call signs would be assigned from the Commission's Group D block; 2 prefix letters, one call sign region number and three suffix letters. "This is most important, as the goal of a codeless amateur license is to bring such licensees into the 'mainstream' of the Amateur Radio Service, and to encourage them to upgrade their license class. It is thus important not to 'label' these licensees as distinct from other entry-level amateurs, or to attach a stigma to the license class."

The League acknowledged that adding a sixth amateur class to an already complex licensing structure adds somewhat to the burden of the volunteer examiner program, which has thus far performed extremely well. ARRL directors asked their officers to examine the amateur licensing structure as part of their long-range planning effort. Overall, it was determined that the advantages of

implementing a new license class now - outweighs the disadvantages, taking into account the desire of many amateurs and prospective amateurs to open this additional gateway to amateur radio.

No-Code Background

The ARRL said the current resurgence in the debate about the creation ofss amateur license is interesting, given the fact that it is a subject that has been repeatedly considered over a span of years.

In 1974, in Docket 20282, the FCC considered the possibility of a codeless amateur license which the League indicated it could support. The "Basic Amateur" license class was to have included Novice theory and a "code recognition" but not a code text copying requirement. Five years later the FCC closed the matter without action stating they required current amateur thinking on the issue in a separate proceeding.

1978's Docket 78-250 proposed a new class of amateur operator license without a Morse code proficiency requirement which would be restricted to handicapped persons. It too was dropped when handicapped amateurs generally did not desire special treatment in the substance of amateur examinations. Rather, they merely asked that examiners take into account their specific needs in procedural aspects of examination administration. The FCC adopted this position and that policy continues to this day. (See 97.509)

Prior to the 1979 World Administrative Radio Conference, Article 41 of the international radio regulations did not require Morse code knowledge if the amateur operation was exclusively above 144 MHz. The ARRL said the United States WARC-79 delegation disregarded the recommendation of the FCC convened Advisory Committee for Amateur Radio (ACAR) and other public comments which suggested no changes to Article 41.

Surprisingly, the United States WARC delegation proposed to drop the international requirement of Morse codeproficiency for operation below 144 MHz in favor of a 'recommendation' that the various countries of the world have such a requirement. The U.S. proposal was defeated by the WARC conferees. The ITU Radio Regulations were ultimately changed, however, to require Morse code knowledge for amateur operation on frequencies below 30 MHz, instead of 144 MHz. Only the 50-54 MHz band was affected by the action.

The League said that event was received extremely negatively by the amateur radio community at a time when the FCC was actively consideing a codeless amateur license in the United States. "...it is not surprising that there existed a strong distrust of the Commission on the subject."

The early 1983 release of Docket 83-28 coincided with fiscal and manpower problems at the FCC. The Commission's examination system

"...was in great disrepute, and frankly in disarray," the ARRL said. Even so, the FCC proposed on its own initiative two codeless license alternative: (1.) the elimination of the Morse code examination element from the Novice class license or (2.) the creation of an entirely new class of license involving a written examination aimed primarily at digital communication techniques.

Without referring to Dick Bash/KL7IHP by name, the ARRL discussed the negative aspects of "at least one firm" publishing study aids which included the exact questions contained in the FCC license exams. The perception was, according to the League, that the Morse code test was theonly portion of the amateur radio examination that meant anything at all.

To solve the written examination problem, the Congress, in 1982, enacted Public Law 97-259 to allow the Commission to utilize volunteer examiners in the Amateur Service. The eventual result was a question pool system from which examiners would draw certain questions according to a formula to prepare their written examinations. To eliminate applicants from "shopping" for easier examinations, the VEC's ultimately agreed among themselves that they would all use exactly the same answers and multiple choice answer formats verbatim.

The ARRL said the volunteer examiner system was not yet in place in 1983 and "...it was not clear whether a private sector examination plan was feasible, much less sufficiently secure to prevent cheating." For this (and other) reasons, the amateur community thus rejected the Commission's 1983 codeless license proposal by a ratio of twenty to one. The Commission terminated the proceeding without action in Decemberof 1983.

Novice Enhancement

The League maintains the "enhanced" Novice class privileges have been a great success in terms of reducing attrition and encuraging upgrading. "What the increase in Novice privileges has not accomplished, however, is to increase significantly the overall rate of influx of new Novices in the Amateur Service. The relatively flat rate of increase in the number of new amateurs since the 1987 'Novice Enhancement' proceeding once again has fueled the debate about a codeless entry level amateur license. There is a desire among amateurs for growth in the Amateur Radio Service, and a desire to reveal to more people the benefits and opportunities of the Service."

The ARRL acknowledged the perception that the Morse code requirement is a barrier to amateur radio entry and creation of a codeless license might attract newcomers.

Conclusion

The League believes "...provided that the Commission avoids the mistakes of administrations which have enacted unsuccessful codeless

license classes, and follows the guidance of those which have enacted successful ones, the creation of a codeless amateur license should be successful here as well. The key ingredients seem to be a substantial written examination, significant incentives to upgrade, provisions for including codeless licensees in the on-air activities of other licensees and assimilating them into the mainstream of amateur radio."

ARRL "respectfully requests that the Commission at an early date, release a Notice of Proposed Rulemaking, proposing the creation of a Communicator class amateur operator license..."

Now What Happens?

The ARRL no-code petition will be placed on official Public Notice - probably ths coming week, along with 11 other related petitions that propose different types of no-code license or other changes in the licensing structure or operator privileges or regulations. (One fellow wanted to change code speeds).

Each will be assigned "RM" (Rule Making) serial numbers. These numbers are issued out of the (FCC) Office of the Secretary. The FCC has just received some additional no-code petitions and these will be considered to be comments on the existing petitions.

The Public Notice will begin a 30-day period during which time interested persons may file comments telling the FCC why they think any or all of the petitions should or should not proceed to the rule making stage. The idea here is to enable the FCC to determine preliminary public reaction to the proposals. If there is vehement opposition the FCC could well decide that the proposal should not go forward. Similarly, if there are substantial expressions of suppor, the FCC will know that there is merit to the idea and will likely proceed.

Following this comment period there will be a short reply comment period in which people on each side of the issues can answer the points raised by their opponents. After this exchange of views, the FCC will decide whether to proceed to rule making.

It is important to note that if the petitions get RM numbers, it means that the FCC has made the preliminary decision to go forward. It has the power to dismiss the petitions out of hand and it will do so if it does not wish to proceed. o the assignment of an RM Number in and of itself represents a first positive step toward a no-code license.

The comments at the RM stage are NOT the place to get into a debate about the particulars of the proposals. The comments, either in favor or in opposition, need ony manifest the ultimate position of the commenting person or group.

In other words, there will be time enough to argue about whether the no-code license should include privileges at 2 meters. The important thing is to let the FCC know one's position on the ultimate issue: whether you are in favor of some form of no-code license or not.

The preliminary round of comments at the RM stage is not just a formality. However, in view of the ARRL's filing, one has to believe that the matter will proceed to rulemaking. The ARRL does not file trifling petitions. Moreover, this matter is strictly internal to amateur radio, and on such matters the FCC pays great deference to the desires of the League. So if the ARRL wants a no-code license, it is likely to get it.

The Commission staff is supposed to take preliminary comments into account when deciding whether to grant the Notice of Proposed Rulemaking (NPRM) desired by the petitioner. Many petitions never receive RM numbers because they are judged to be repetitive, frivolous or otherwise not deserving of serious consideration. Most, but not all, of the petitions that do receive RM numbers will eventually make it to the NPRM stage.

The FCC's Personal Radio Branch has a small staff and budget for the large amount of work they have to do in researching petitions, drafting rules, working on enforcement cases, monitoring the VEC program, ...and the like.

For this reason, Branch Chief John Johnston/W3BE told us informally that he thought amateurs ought to hold their comments until the NPRM stage: "We're not really looking for comments on these items. It would just slow things down to throw in comments at this phase. It would be better to wait until a NPRM to file comments. We still have a pile of other petitions to work on, some that people have been waiting a long time for. While we were working on the Part 97 rewrite, the hams kept on thinking of things to do."

Following the preliminary round of comments, the FCC will decide whether to proceed. The next thing that will come out will be either a Memorandum Opinion and Order, killing the proceeding (once the RM number is assigned, the FCC can no longer dismiss it out of hand; it must explain why it changed its mind); or a Notice of Proposed Rule Making (NPRM).

if the FCC issues the NPRM, it will represent the FCC's first cut at what the no-code rules and privileges look like. (The Commission could also issue a Notice of Inquiry which seeks more information, but this path of action is extremely doubtful).

The NPRM will be a distillation of all of the suggestions contained in the various petitions, plus anything useful that might have been said in comments. This is where the heavy analysis comes in. This is where the particulars are hammered out: what bands; what privileges; ...what testing requirements. We expect a Notice of Proposed Rulemaking will consolidate some or all of the petitions

within the next six months - although it could happen by Christmas.
n other words, the FCC will not release 12 different no-code NPRM's.
Instead, a single no-code NPRM will emerge, possibly accompanied by
NPRMs dealing with rules other than the Morse code requirement. This
scenario is only speculation on our part. FCC staff are keeping
their plans confidential.

In any event, don't expect fast final action by the Commission. Rule
making takes time. Even if this matter is put on a fast track for
decision, a no-code license is probably still a year off.

[End this issue]

Such designs exist, but there's one $upremely $ignificant rea$on why such ELTs haven't been adopted -- not cost to buyers of new ELTs, but to owners of old ELTs.

Back when I was active in SAR, we often heard of such designs; always with the "not gonna buy some newfangled gear when mah old gear is good enuff" problem built in.

We can hope that the design will be adopted and the new units will replace the old by attrition, but you never know....

These general aviation types complain loudly (and, IMHO, justifiably) about the additional cost of new "standards" imposed on them by the FAA. Still, most of this stuff will make life longer and safer (and richer for the mfgr.s of the equipment) for all of them.

We'll see what happens -- it may be more than attrition of older units; it may be natural selection of the pilots ;^).

3092. Mods to Yaesu FRG-7700 receiver

Newsgroup: rec.ham-radio
Date: 1989-10-05 03:56:10 UTC
From: daf00@uts.amdahl.com
Message-ID: <e0=A02I95cQ301@amdahl.uts.amdahl.com>
Source record: 16507

Does anyone know how to change the format of the clock display on a Yaesu FRG-7700 receiver from 12-hour AM/PM format to a 24-hour format? The schematic shows the clock chip to be a MSM5524RS IC and I can't find a parts book with any info on it. I was hoping to find a pin which could be used to select the 24-hour format.

Also, has anyone changed the bandwidth filters on this radio? It has narrow/medium/wide values of 2.7khz/6khz/12khz. I would be interested if you have changed filters to get a tighter bandwidth and how you did it.

Thanks in advance for the help.

From: GB7HQQ@GB7HQQ

Text of the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

Raynet was involved in the aftermath of the explosion at the Royal Marines School of Music at Deal in Kent last week. South Kent Raynet was called at 1030 by the British Red Cross, and shortly afterwards Kent Police requested the provision of communications facilities for the Red Cross since the telephone system had become overloaded. Raynet was stood down at 1630. A fuller report will appear in Radio Communication.

Last July, Peter Dixon, G0HFQ, and his wife Gwenda were murdered whilst on holiday in South Wales. The Dyfed-Powys Police are still anxious to talk to any person who contacted Peter whilst he was operating as GW0HFQ mobile between the 19th and 29th of June; it's thought that he was using the 80, 40, 10 and 2 metre bands. The police also believe that Peter Dixon had a contact with a mobile station on 10 metres using FM on the morning of Wednesday the 28th of June. They also believe that he contacted someone named Tom on Sunday the 25th of June, although they do not know which band the contact took place on. Dyfed-Powys Police would particularly like to speak to the operators of both these stations. Anyone with any information is asked to contact the Murder Incident Room at Haverfordwest Police Station. The telephone number is 0437 763355.

The Blackwood Amateur Radio Rally takes place today, at Oakdale Community College. All the usual attractions will be available, and the doors open (opened) at 10.30 am.

Next, some repeater and beacon news. The Lakeland Fells UHF repeater GB3LF has now returned to service from its new site at Lancaster. It is on channel RB14, and reports would be welcomed by its keeper G8UHO. GB3SW, the Salisbury UHF repeater, will return to service from a new site on Saturday the 7th of October. It is on channel RB9 and more information is available from G3YWT. The Kingston-upon-Thames packet mailbox GB3KP has inaugurated a new 432.675MHz port, under the callsign GB7KUT. Finally, the Cornish 430MHz beacon GB3CTC is now back

on the air on 432.97MHz.

A number of new repeaters and mailboxes have been approved by the DTI. The list is too long to read out, but details are available from the Membership Services Department at RSGB Headquarters or via the packet network and will appear in the next-but-one issue of Radio Communication.

The annual Old-Timers QSO Reunion between members of RAOTA and the Dutch OTC will take place tomorrow and Tuesday, between 0830 and lunchtime each day. Those interested are asked to call on 3600 kHz for SSB and 3550 kHz for CW. If 40 metres is usable, calls can be made around 7070 and 7025 kHz respectively. Members of RAIBC and others interested in the event are invited to take part.

The RSGB's Prestel database will be on show at the Personal Computer Show at Earl's Court this week, on the ClubSpot stand.

The Post Office has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0MI and G7FU series.

Subject: GB2RS 1 Oct (2/11): HF CONVENTION
Path: GB7CHS!GB7DQW!GB7SUT!GB7LRG!GB7SPV!GB7HHH!GB7HQQ

From: GB7HQQ@GB7HQQ

The RSGB National HF Convention is taking place on Sunday 1/10/89. It's a one-day convention with a comprehensive programme of lectures, and in a special ceremony at 3.30 pm the DTI will announce the name of the 1989 Young Amateur of the Year. The Society will announce the names of the runners-up, and the prizes will be presented in the presence of a number of distinguished guests. Several RSGB committees have stands at the Convention, and a member of the Planning Panel will also be present.

The Chairman of the Society's EMC Committee will be announcing the new EMC Co-ordinator's scheme at the Convention. The intention of this scheme is to provide local contact points for general EMC advice, initially by telephone or post. There will be more information in a subsequent edition of Radio Communication.

The venue for the HF Convention is the Belfry Hotel at Milton Common, near Oxford. The doors open at 9.30 am, and light lunches and snacks will be available. More information on the Convention was given on page 27 of the September edition of Radio Communication, which also showed a map of how to get there.

From: GB7HQQ@GB7HQQ

The period between the 18th and 24th of September was affected by a large magnetic storm and aurora, which is believed to have been the result of a disintegrating filament. Both sunspot and solar flux levels have declined; the sunspot count has fallen from around 200 to about 150, although this is not surprising since the quiet side of the sun has been facing Earth. Solar flux levels have also declined, and averaged 200 for the period; levels fell to only 160 units on the 22nd. Geomagnetic levels were unsettled until the 17th. A sudden magnetic storm commenced at 1748 on the 18th, and it lasted until 1200 on the 19th - as a result, the geomagnetic A index rose from 44 units on the 18th to a full storm level of 82 units on the 19th. The average for the period was 28 units.

The solar wind particle input was reasonably high until the 22nd. The radio quality indices were above normal until the 17th and there was a typical pre-auroral enhancement, but it collapsed on the 19th and almost all circuits were unusable. However, the effect did not last long and levels were back to normal by the 20th. The Inda index for the period between the 11th and 17th was unsettled.

And now the ionospheric data for England and Wales. The daytime F2 critical frequencies at Slough, as reported by Appleton, averaged 9.6MHz. Levels fell from 10.9MHz on the 18th to only 4.9MHz on the 19th - which is the lowest since January 1988. However, they were back to a much more reasonable 11.1MHz by the 22nd. The darkness hour lows averaged 3.9MHz but they were seriously affected a number of factors. These included aurora, spread F, other phenomena, complete absorption and attenuation lasting for up to 7 hours on some days. By the 24th, however, it appeared that a recovery was under way.

Ionospheric data Scotland N.Ireland

Unfortunately the ionosonde at South Uist was out of action for the 23rd and 24th, so the data available is only for the period between the 18th and the 22nd September. Daytime F2 critical frequencies were depressed as a result of the high levels of geomagnetic activity and aurora. Although the average level was 7.9MHz, it fell to only 5.4MHz on the 19th, which was the lowest since September 1988. The darkness hour lows also declined and averaged 3.5 MHz, with only 2.1MHz on the 19th. There's been spread F, other phenomena, blanketing E and Absorption lasting for up to 10 hours on some days - overall, there was no good day during this period.

And finally the solar forecast. The more active side of the sun will be facing Earth this week, and solar flux levels may reach around 280. Geomagnetic levels are expected to be unsettled. Ionospheric M.U.Fs at equal latitudes are expected to reach 30 MHz in the south and 26MHz. Darkness hour levels should reach 14MHz, but geomagnetic and spread F could affect the north.

Meetings on Monday the 2nd

Basingstoke Amateur Radio Club meets at 7.30 pm at the Forest Rings Community Centre, Sycamore Way, Winklebury for the annual general meeting. More information is available from G3ZOI on 0734 332777.

Braintree & District Amateur Radio Society meets at 8 pm in the Community Centre, Victoria Street for an informal evening. More information is available from an unidentified lady or gentleman on 0376 27431.

Southdown Amateur Radio Society meets at 8 pm in the Chaseley Home for the Disabled, Bolsover Road, Eastbourne for a surplus equipment sale; booking-in begins at 7 pm. A guest from the Soviet Union - Igor, UA3QJC - will be present. This is a change to the advertized programme. More information is available from G1UND on 0323 504194.

Surrey Radio Contact Club meets at 7.45 pm at the training ship Terra Nova in The Waldrons, Croydon for the autumn surplus equipment sale. More information is available from Peter Burchett on 01-647 9301.

Burnham Beeches Radio Club meets at 8 pm in the Haymill Youth & Community Centre, Burnham Lane, Slough for an extraordinary general meeting. All members are asked to attend. More information is available from G6TSF on 0753 41396.

Meetings on Tuesday the 3rd

Chelmsford Amateur Radio Society meets at 7.30 pm in the Marconi College, Arbour Lane for the annual general meeting. More information is available from G4FKH.

Chichester & District Amateur Radio Club meets at 7.30 pm in St Pancras Hall, St Pancras, Chichester for a junk sale. More information is available from G1NBX on Chichester 781785.

Meetings on Wednesday the 4th

Cheshunt & District Amateur Radio Club meets at 8 pm in the Church Room, Church Lane, Wormley for a social evening. More information is available from G4OAA on 0992 464795.

Aylesbury Vale Radio Society meets at 8 pm in the Village Hall, Hardwick for a talk on rocket instrumentation and guidance by G4NUG. More information is available from G4XZJ on 0296 81097.

Worthing & District Amateur Radio Society meets at 7.30 pm in the Parish Hall, South Street for a discussion evening. More information is available from G4GPX on Lancing 753893.

Meetings on Thursday the 5th

Vange Amateur Radio Society meets at 8 pm in the main hall of Barstable Community Centre, Long Riding, Basildon for a junk sale. More information is available from G3PLF on 0268 524453.

Maidenhead & District Amateur Radio Club meets at 7.30 pm in the Red Cross Hall, The Crescent in Maidenhead for a junk sale. More information is available from G8XYN on Maidenhead 25952.

Next Sunday, the 8th of October, the Communications 89 rally and computer exhibition takes place at Hillhead Camping, Hillhead, Brixham from 10am onwards. Talk-in will be available via G7FBC, and the special-event callsign GB4CPU will be on the air from the rally. Drivers are asked to take care approaching the site and also to maintain radio silence. More information is available from G6RZM on 0803 522216.

Meetings on Monday the 2nd

Weston-super-Mare Radio Society meets at 7.30 pm in the Woodspring Hotel, High Street, Worle for a talk on Indian railways and local technology by G6TAL. Visitors are welcome. More information is available from G0KBT on 0934 514429.

Mounts Bay Amateur Radio Group meets at 7 pm in the Diver's Club, Albert Pier, Penzance at 7pm for RAE and morse class enrolment. More information is available from G0BBA on 0736 796899.

Meeting on Tuesday the 3rd

South Dorset Radio Society meets at 7.30 pm in the Wessex Lounge at Weymouth Football Club for a talk on home-brew equipment by G3SDO. More information is available from G4FJO on Weymouth 781164.

Meetings on Wednesday the 4th

South Devon Radio Club meets at an unspecified location at 7.30 pm. More information is available from PO Box 4, Brixham.

South Bristol Amateur Radio Club meets at 7.30 pm at the Whitchurch Folkhouse Association, Bridge Farm House, East Dundry Road, Whitchurch for a computer and audio bring-and-buy evening. More information is available from G4RZY.

Thornbury & District Amateur Radio Club meets at 7.30 pm in the United Reform Church, Chapel Street, Thornbury for a packet radio update by GW1FJI. More information is available from G0FGI on 0454 411062.

Meetings on Friday the 6th

Torbay Amateur Radio Society meets at 7.30 pm in the ECC Social Club, Highweek, Newton Abbot for a club night, More information is available from G4VPM on 0803 39055.

Axe Vale Amateur Radio Club meets at an unspecified time and location for the annual general meeting. More information is available from G0GHH on 0297 33756.

3094. Re: Reply to Chris's query about the R-S Discone...

Newsgroup: rec.ham-radio
Date: 1989-10-05 11:30:37 UTC
From: parnass@cbnewsc.ATT.COM
Message-ID: <3660@cbnewsc.ATT.COM>
Source record: 16427

In article <8910041536.AA10211@ti.com>, rlwest@flopn2.csc.ti.com (Bob West - WA8YCD) writes about discones:

> The advantage I see is that it *is* wideband :> while the disadvantage
> is no gain :< (uh oh! LOGIC ALERT! "No Pain, No Gain!" IS THIS A PAINLESS
> ANTENNA?)

One of my antennas is a military discone and I use it often, but
here are other disadvantages of a discone:

1) not at DC ground ==> potential lightning hazard
2) broadband response can exacerbate image and intermodulation
problems on receive
3) broadband response can exacerbate spurious and harmonic
problems on transmit

The Radio Shack discone lacks the whip element found on the Icom
and Diamond discones, so forget about decent reception on
the 30-50 MHz band.

3095. Radio Shack Model 30 scanner

Newsgroup: rec.ham-radio
Date: 1989-10-05 12:47:31 UTC
From: bill@moogvax.UUCP
Message-ID: <1024@moogvax.UUCP>
Source record: 16516
Cross-posted to: rec.ham-radio,sci.electronics

A colleague has a portable scanner identified as a Radio Shack Model 30. It is an older unit which he bought used. He has noticed that it cannot be set to frequencies between 136 and 138 MHz.

a) Does anyone know if this is normal for this unit and if so, what is the reason for this ommision in coverage?

b) Is there a mod to correct this ommision?

Please reply to moogvax!bill@cs.Buffalo.EDU and I will post any significant findings.

3096. ARRL EMAIL !! READ THIS PLEASE

Newsgroup: rec.ham-radio

I spoke to Jon Bloom at the ARRL about the E-Mail. Jon said that anything coming in that route ends up on his desk-top PC and he has no way to distribute it. Apparently it's not an "official" route and Jon gave a strong message that he would appreciate not getting deluged with mail. I don't know how far ranging the E-Mail info is, but it looks like anything going in that route will end up in the bit bucket!

3098. PL259 connector assembly

Newsgroup: rec.ham-radio
Date: 1989-10-05 13:58:32 UTC
From: MEHARP01@ULKYVM.BITNET
Message-ID: <8910060704.AA23808@ucbvax.Berkeley.EDU>
Source record: 16518

I picked up some RG-8/X coax, some PL259 connectors (silver plated) and the UG-176 adapters for the connectors at a local hamfest. I want to build up some better coax for my dipole than what I am using now.

I understood the instructions for the cable assembly in the ARRL Antenna Handbook. They even had instructions for this connector. I had two problems. One, I simply cannot seem to figure out how to fan back coax braid neatly! Two, it was VERY difficult to slip the adapter onto the cable. I got it assembled, but it was a fight. More so than i'm sure it should be. This is another one of those jobs that more experienced types tell me is "easy."

Can someone help me out? Did I have too much trouble?

Well, the 1989 WRTH does not have a listing for it, and I haven't heard the station for at least a year, so I think it would be safe to assume that it is gone for good.

3102. Field Day... OK... A proposal:

Newsgroup: rec.ham-radio
Date: 1989-10-05 18:23:31 UTC
From: GFWT@ALASKA.BITNET
Message-ID: <8910060702.AA23684@ucbvax.Berkeley.EDU>
Source record: 16439

I like Field Day...
I liked it a lot better when I lived at a more temperate latitude, although I must agree that midnight sun makes setting up for FD a hell of a lot easier, and the time difference means that you can be home in time for a sunday afternoon BBQ. But, I would say this:

While it is true that FD does to some extent demonstrate our abilities in less than optimum conditions, it does so only on the first full weekend of summer. Additionally, it is probably not a realistic demonstration of our emergency capabilities (probably a reason we also have SET)as much as our camping abilities.

Lets make a more realistic and perhaps more fun contest.

A winter FD (Note this is coming from someone that survived three weeks of -60F weather last winter).

Lets put it DURING THE WEEK between Christmas and New Years (so it doesn't conflict with some other contest). Lets make it so that stations at home can participate, because emergency communications consist of people at the location of the emergency, and people at home (or equivalent) handling the messages. This is to say that there is more to emergency preparedness than knowing where all your camping gear is. Lets make it so that there is a premium to working all ARRL sections, so that people away from the fray, like AK and HI have a reasonable chance of making contacts. Lets limit the power to the 0-200 watt range, with no particular benefit to QRP.

I'd propose that portable stations can work anyone, and home stations can work only portable stations. (This means that portable stations need to ID themselves as such) Lets make the exchange ARRL section and temperature. negative numbers (like in the temp) would be sent on CW with a leading "B" like... UR AK B25...

Anyway... I am just brainstorming here... what do y'all think?

Source record: 16440

What do people think of AntennaX? I see it advertised, and got some ads for it, but I'm not skilled enough to evaluate its quality.

><really interesting stuff about aperture, Q, matching, and such like>

> Anyway, helical or not, short dipoles and monopoles do have very nearly
>the same gain as as full size dipole but they are tough to feed efficiently
>especially when they get very short. I don't know the typical numbers, but
>I doubt that typical rubber duckies are too far down from full size whips.
>Usually they are at least 25% of full length anyway.

Well, I've got 2 rubberducks for my 2m ht, one is about 3" long, the
other about 5 or 6 inches long. The 6" would be 1/4 of a 1/4 wave :-),
but I hate to think about the 3" one (1/8 of a quarter wave?).

However, since we are considering the effeciency of the entire system,
I a 90% effecient antenna which can only get 10% of the transmitter
power into it would still be only ... um... 9% effecient? This implies
that the transmitter you use can make a big difference in the results,
and also I suppose frequency could make a large diff, also.

> Maybe someone on the
>net has done some experiments and can report.

That would be great! Anyone want to take that up as a project, if it
hasn't already been done?

My Dad and I 'accidentally' worked A61AC last week on 20 meters using the
R5 instead of the TH7. No wonder it took us longer to crack the pileup!
So I have to say I like it.

In article <683@ariel.unm.edu> ee5391aa@hydra.unm.edu.UUCP (Duke McMullan n5gax) writes:
+
+Such designs exist, but there's one $upremely $ignificant rea$on why such ELTs
+haven't been adopted -- not cost to buyers of new ELTs, but to owners of old
+ELTs.
+
+Back when I was active in SAR, we often heard of such designs; always with the
+"not gonna buy some newfangled gear when mah old gear is good enuff" problem
+built in.
+
+We can hope that the design will be adopted and the new units will replace the
+old by attrition, but you never know....
+
+These general aviation types complain loudly (and, IMHO, justifiably) about the
+additional cost of new "standards" imposed on them by the FAA. Still, most of
+this stuff will make life longer and safer (and richer for the mfgr.s of the
+equipment) for all of them.
+
+We'll see what happens -- it may be more than attrition of older units; it may
+be natural selection of the pilots ;^).
+

Seems to me that you feel that GA types have an unlimited supply of money
to spend. The difference between an 'old' ELT and one of the 'new' safer
ones is in the neighborhood of $6000. Many GA types paid less than that
for their entire airplane. My first 172 cost me $7000.

With all the red tape of type approval, air worthiness certification,
supplimentary type certification, FAA approved repair station, FAA
inspector, liability insurance, and such, that a manufacturer ends up
selling what should cost $35 for $2000. How much should it cost to
buy a 720 channel, 10 watt, AM transciever??

The last one I bought was used, and 10 years old, and still cost me $800.

The general public refused to pay $200 for airbags in their automobiles
for years. Maybe the natural selection process will cause an attrition
of older drivers also.

3112. Re: How good is RS's discone antenna?

Newsgroup: rec.ham-radio
Date: 1989-10-06 00:06:40 UTC
From: cyamamot@girtab.usc.edu
Message-ID: <5540@merlin.usc.edu>
Source record: 16437

In article <272@trux.UUCP> car@trux.UUCP (Chris Rende) writes:
>I'm planning to purchase Radio Shack's $70 discone antenna for my PRO-2004.
>It is supposed to cover 25Mhz to 1300Mhz.
>Does anyone have any experience with this antenna?

Well let me throw in my 2 cents. I have only used it once to transmit on 2 meters with a 10 Watt mobile Kenwood. It worked fine.

I have my RS discone hooked up to my PRO-2004 as well. I have mine up 45 feet using Belden 9913 cable. You should use low loss if you intend to listen to anything in 800 Mhz or 1296 Mhz. I can easily receive transmissions on these two bands from base stations up to 30 miles radius from my location.

As Bob Parnass mentioned, since there is no extended whip like the Icom has, the 30-50 Mhz range won't be so hot. This is true as I monitor Calif. Highway Patrol at 42 Mhz. The mobiles I used to hear with my VHF-Lo/VHF-Hi antenna were down in the noise with the discone. However, since I have a separate scanner dedicated for CHP monitoring, I bought a GaAs FET LNA, tuned it to 42 Mhz and hooked it right in front of the receiver. This is usually a no-no, but if you're using super low loss cable like 9913 the preamp does help. It is NOT a wideband preamp, but actually is down 3db at +/- 750kHz. Has a NF of 0.8 dB, Gain of 24 dB and a 1 dB compression point with 1 dBm input. It's a kit I made from Hamtronics.

>Is there another company that makes a better general coverage antenna for
>the same price?

Yes, there is Icom but it costs more. If you really *have* to cover weak mobile signal on the 30-50 Mhz band, you're better off with Icom. I'm happy with the RS discone because I have the luxary of putting a preamp in front of a dedicated 30-50 Mhz scanner.

By the way, Diamond has/had a discone which is actually made by a Japanese manufacturer in Japan (forget the name). This discone is the exact same one available in Radio Shack for $10 less.

In any event, keep this in mind. If the antenna is made with any decent material, it won't cost below $30. The reason RS and others discones are so expensive is because the elements are made of stainless steel. Not aluminum like the cheaper antennas.

Happy monitoring!
Cliff de KA6JRG

From: GB7HQQ@GB7HQQ
To: NEWS@GBR
Subject: GB2RS 8 Oct (1/10): MAIN NEWS
Path: GB7CHS!GB7DQW!GB7SUT!GB7LRG!GB7SPV!GB7HHH!GB7HQQ

From: GB7HQQ@GB7HQQ

We must apologise for the fact that some items may not have been included because of problems with the GB2RS telephone line and also difficulties with postal delivery. The QSL sub-manager for the G7 prefix series is currently holding about 2,000 unclaimed QSL cards. He cannot continue to store these indefinitely because of limitations of space, and in about a fortnight's time he will be forced to begin destroying them. Any member with a G7 callsign prefix who would like his or her QSL cards is asked to send stamped addressed envelopes to Mr D J Hudson, G6OVO. His address is 62 Derron Avenue, South Yardley, Birmingham B26 1LA.

The Sussex Coast VHF repeater, GB3SR, will be switched on from its new site above Brighton today. More information is available from Derek Stewart, G4HSY. The Bristol packet repeater GB3FC now has a port on 70.4875MHz - more information from G4WRW. GB3BN, the Bracknell UHF repeater, returned to service on the 30th of September after repairs to the transmitter.

The new chairman of the Society's Membership Liaison Committee is Mr Geoff Smith, G4AJJ.

Holyhead & District Amateur Radio Society will be operating GW0BNX on 3.5 and 144MHz from SH67 today. A special QSL card will be available.

Cumnock & District Amateur Radio Group will be operating GM0LOB from Mauchline in Ayrshire next Saturday, the 14th, to give a demonstration of amateur radio and raise funds for the 'Heart Start' campaign. All contacts made will be sponsored by local traders, and funds will go towards the purchase of defibrillators. More information is available from Ms Anne Campbell on 0290 22168.

Difficulties are still being experienced by RTTY users in various parts of the UK with phone transmissions on 145.3MHz. The current band plan allocates this frequency specifically for RTTY use, and members are asked to avoid using it for phone contacts.

Milton Keynes & District Amateur Radio Society is running its third amateur radio car boot sale next Sunday, the 15th, at Cranfield Airfield in Bedfordshire. The event runs from 9.30am to 4pm, and bar and refreshment facilities will be available. Talk-in will be available on S22. More information is available from G0FMC on 0908 566796.

The Society would like to inform its members that the October edition of Radio Communication was posted on the 2nd of October. Members should be receiving their copies shortly.

The Post Office has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0MJ and G7FV series.

Path: GB7CHS!GB7DQW!GB7SUT!GB7LRG!GB7SPV!GB7HHH!GB7HQQ

From: GB7HQQ@GB7HQQ

Some information is not available this week as a result of computer problems, but there was a large-scale decline in solar activity between the 23rd and the 28th of September. An M3 1F flare took place on the 25th and a flare alert was issued, but hardly anything came of it. There's been a considerable reduction in geomagnetic activity; sunspot counts have also fallen to around 100, and solar flux levels declined to an average of only 163 units. This is the lowest since last March. Geomagnetic levels were very quiet up until the 28th, and a level of only 3 units was recorded on the 23rd, but a sudden small storm on the 26th raised this to 28 units. The geomagnetic A index averaged 10 units. The radio quality indices increased to the highest levels since last February, in what appeared to be a classic pre-auroral enhancement. Some circuits were 50 per cent above normal on the 24th. However, with the large increase in geomagnetic levels on the 26th, the indices fell to well below normal.

And now the ionospheric data for England and Wales. Daytime F2 critical frequencies at Slough as reported by Appleton have increased considerably; they are now at their highest level since last February. The average was 11.7MHz. A figure of 13MHz was recorded early on the 13th, which is the highest daily level since last March. In a continuation of the seasonal effects, the darkness hour lows declined and averaged 3.7MHz.

And now the ionospheric data for Scotland and Northern Ireland. The daytime F2 critical frequencies at South Uist on the 26th reached 12.1MHz, which was the highest daily level since last February. The average for the period was 9.6MHz, which again is the highest since last March. Darkness hour lows have declined and averaged 2.9MHz, in line with what might be expected as a result of seasonal effects. Some spread F and other phenomena were reported after the 26th, but it had declined to about 3 hours a day by the 28th.

And finally the solar forecast. The more active side of the sun will be facing Earth this week; flux levels are expected to increase and average

about 200. Geomagnetic levels could be unsettled, particularly towards the end of the week. Ionospheric M.U.Fs at equal latitudes during daylight should reach about 33MHz in the south and 29MHz in the north. Darkness hour lows may fall slightly, but 13MHz should be possible.

There was some tropospheric propagation on the VHF and UHF bands at the beginning of last week. GM4IPK in the Shetlands is reported to have worked stations on the north coast of Spain, and the Faeroes 144MHz beacon was audible in many parts of the UK last Tuesday evening.

I understand that there are two definitive sources for meaningful reviews of HF communications receivers, the Radio Database Int'l series of papers and a book written in Germany that has comprehensive reviews of many radios.

Is there anyone out there that knows the name and author of the book, and where it can be purchased in the US, and whether either the book or Database papers review the Racal 6790, Drake RR-2, or Drake RR-3 receivers?

Thanks!

I have been using Radio Shack's Discone for several months now. It is mounted on a 20' pole attached to my chimney. It is doing a fantastic job as a wide band receive antenna for my Radio Shack PRO-2004 scanner and also as a transmitting antenna for my 2 meter ham rig. I get an SWR of about 1.2/1 on 2 meters. The antenna is very sturdy and easy to assemble. The instructions are very skimpy, but do the job. The key for UHF frquencies is to use low loss cable and keep it as short as possible. If you use 100' of RG-58 don't expect to hear much above VHF.

1/2 right, but an A for effort! The radio must be licensed, the person is not required to be. A Third Class Restricted Radio-Telephone Operator Permit is not required anymore in the USA. However, by international agreement, if you operate the radio in waterways of other countries, you need the Permit. I just wanted to clear up what is REQUIRED.

Having said all that, I suggest that you get both the Operator's Permit and the Radio License. The FCC will immediately tell you that you don't need the Permit anymore. You can still get one by stating "I expect to operate internationally", then they will help you out.

In a recent Gateway they INVITED e-mail via 70645.247@compuserve.com. This would get to them during routine logons with CompuServe, which they apparently do regularly in order to use the HAMSIG area. I don't know if Stan Horzepa is the only one to use that account, but he's the one who suggested using it.

Not to belittle Preacher's friends, but fires, like heart attacks, hurricanes and tornadoes, are among those universal human tragedies which cause everyone to drop 'business as usual' and pitch in to help. This characteristic, when exhibited by CB'ers, demonstrates that they are salvageable members of the human race.

I'm sure there are licensing provisions for land stations in the marine service. Dock masters, bridge tenders, etc., operate on marine frequencies for contacting boat operators they are dealing with. Incidentally, the emergency channel on the marine band is Channel 16. The Coast Guard monitors it closely.

I don't know about the Restricted Permit business. (I thought they quit issuing licenses for all except certain classes of broadcast station operators.) But the radio needs to be licensed. I forget the form number, but I'll bet anything the number and perhaps even a copy of it will come in the users manual of the radio.

3121. Sony ICF2003 vs Panasonic RFB60

Newsgroup: rec.ham-radio
Date: 1989-10-06 16:08:21 UTC
From: stoppani@decwet.dec.com
Message-ID: <8910061608.AA26853@decwrl.dec.com>
Source record: 16445

I'm considering purchasing a new portable shortwave radio. I'm interested in a radio that is relatively small and one that has the following features:

Digital readout
Clock/Alarm
Full coverage of all bands (or as close as possible)
FM
Decent signal strength indicator (LEDs are okay)
At least 10 memories
Price under $250
...and obviously, good performance!

It would also be nice if the unit had an external antenna jack.

From the literature I've narrowed it down to the Sony ICF2003 and the Panasonic RFB60 (the RFB40 also seems like it would do). Also, in a recent add I've seen a Panasonic RFB65-SSB (which seems to be an RFB60 + CW/SSB) and a Sangean ATS808; unfortunately I haven't seen any reviews of these so I'm not sure if I want to consider them.

Has anyone had experience (good and bad) with any of these radios? Any information would be most helpful.

Thanks in advance,

Pete...

Somwthing that may excite portable packeteers just crossed my desk. It's an announcement of the new Atari "Portfolio", a computer about the size of a VHS cassette selling for $399 list.

It's said to be "MS-DOS 2.11 Compatible", whatever that means, and will run for "six to eight weeks under normal use" on 3 alkaline AAs. RAM supplied is 128K with expansion to 640 possible. There are nonvolatile RAM, ROM and PROM cards available for software.

Now, one of these, a tiny TNC and a 2SAT and who needs that neat Motorola box that the IBM guys carry? :> I'll buy mine as soon as someone puts KA9Q's package on a ROM card.

Cross-posted to: sci.electronics,rec.ham-radio,sci.astro,sci.physics,sci.chem

In _The_Amateur_Scientist_ section of Scientific American, Feb 1968, page 124, there's a description of a differential magnetometer capable of detecting a minimum difference in field strength of 3e-5 oersted. The magnetic field of the earth causes protons in water molecules to precess at a rate of about 2025 Hz. The article describes a device consisting of two bottles of water with coils wound around them, and a high-gain (2e6) tuned amplifier. A dc current is passed through both coils to align the magnetic dipoles, then the current is removed and the amplifier is connected to the coils. A beat frequency proportional to the difference in the magnetic fields at each bottle is heard at the output of the amplifier.

It might be interesting to build a more modern version of the system described in the article. Another installation of _The_Amateur_Scientist_ describes another NMR setup and suggests adding ferric nitrate to the water. Why?

I'm trying to get information on picking up weather maps on the HF band, what i'd like to do is either dump them to a printer or just store them in my computer. However I'm having a problem finding out the best way to go about this. The maps i'm most interested in will be frontal and isobar projections. So far i sound out i need a radio such as the Radio Shak DX-440 (any opinions on that radio ??) and some type of "modem", and of course the computer/printer. I don't really care about the computer type since I'll probably hack my own software. However I would like this system to be portable. I saw a add (from the CQ 1990 Buyers Guide) for the AEA PK-232, however $320 is a bit much for the budget since i won't EVER send fax's and only want the weather stuff.

Thanks in advance for any help --- (no flames, i'm new at HAM)

In article <13770036@hprmokg.HP.COM> barry@hprmokg.HP.COM (Barry Fowler) writes:
>
>A marine radio requires a Restricted Class Radiotelephone License.

I just went through this when I bought my O'Day 25 sloop, so let me clarify a couple of things. A marine radio requires a Shipboard Station License. This is issued by the FCC and is good for a period of five years. I forget the form number you use to apply, but the FCC can tell you.

A Restricted Radiotelephone Operator Permit is no longer needed if you don't make international voyages. If you decide to head up to Canada, you need one. You might as well get one; it's free, there's no examination, and it's good for life.

>Your best bet is to write your local FCC field office (see Federal Govt.
>listings in phone book) and request the application form.

Or, just give them a call. I called the Seattle office and asked for their marine radio package. It arrived in the mail about a week later. The package contained all the necessary applications, some commonly-asked questions, some neato stickers for near the radio like "Use Minimum Power", channel allocations, etc.

>Note that marine radios are for use only when in a vessel and not for
>land communication usage. Typical call interchange is to state the vessel
>name and license call letters. You should become familiar with marine
>radio usage/frequencies before getting on the air (you wouldn't want to
>"stumble" on an emergency frequency. Also, calling a local marine electronics
>business may give you additional information.

All very true. *PLEASE* don't use your radio on land. You're opening yourself up to prosecution. The FCC is deadly serious in enforcing the Part 80 regulations.

Be sure to give your call sign as well as your vessel name. It's required.

Channel 16 is the calling/emergency frequency. Channel 13 is for bridge-to-bridge safety communications and you are limited to 1 watt of power. Etc.

Note that the main purpose of the Marine Service is *safety*. You can call your buddy in the other boat and give your ETA, you can call the harbor master and request transient moorage, but, if you want to chat, get on the CB or your ham rig (if you're licensed, and you *should* be :-)).

I'm assuming that the radio you picked up is a VHF-FM rig. If it's an HF SSB/CW rig, you can't use it. FCC regs state that a vessel must be equipped with VHF before it can be equipped with HF. Even then, they usually won't

give you an HF license unless you can demonstrate to their satisfaction that you will be operating out of the range of shoreside VHF installations. In effect, you need to be going out on the open ocean before you can install HF.

Also, consider wandering down to your friendly neighborhood GPO bookstore and picking up Part 80 of Title 47 of the Code of Federal Regulations, aka Part 80, 47 CFR.

It'll cost you about 20 bucks, but a good volume would be "47 CFR, Parts 80 to end". Read Part 80 and understand all applicable rules. There are lots of things you won't care about, however. Then turn to Part 97 and read about Amateur Radio and think about getting your license (hint, hint).

By the way, when you fill out your license application, you will state that you are a "Voluntarily Equipped Vessel".

Also, when you sell the boat, you send the station license back to the FCC for cancellation; it neither stays with you nor with the vessel. Your Restricted Permit, however, is yours forever.

That's about it. Good boating.

I _like_ the idea of a winter field day! It gets COLD here too, but only down to -20F. I mean, B20. At that temperature, wire insulation tends to crack, generators tend to not start, and weaknesses in many areas of preparedness tend to stand out.

Along the same lines of emergency preparedness, one cold winter day our amateur radio club (BYU's BYUARC, W7OHR) decided to see how the shack did on the emergency power provided in the student activities building. It happened to be the coldest day of last winter. My radiator froze, and I didn't make it there. The emergency generator did not start because it was next to a permanently open vent and its oil turned to tar. It was a diesel, and had a thermal switch that disabled the starter at too-cold temps. So you can see the value in such an experiment! We put the vent on a thermostat, and I put more antifreeze in my car.

I don't know if I would want a winter field day every year, though. Or maybe one could work every other winter field day from in front of the stove.

3131. ATV Balloon Launch Info

Newsgroup: rec.ham-radio
Date: 1989-10-07 11:22:12 UTC
From: look@uicsrd.csrd.uiuc.edu
Message-ID: <54900002@uicsrd.csrd.uiuc.edu>
Source record: 16453

In response to the request for more info on the balloon launch:

Balloon package will contain ATV transmitter on 439.250 mhz. Power out 1 watt horizontally polarized. Video provided by SONY CCD camera shooting into a mirrormounted on a servo. Mirror will provide views from straight down to the horizon.

We hope when the balloon reaches 100,000 ft this horizontal veiw will show the curve of the earth. There will also be a flight computer on board displaying call signs, elapsed time, altitude, out-side and inside temperature, and battery voltage. This information will be on the lower portion of the camera video.

A video generator displaying two IDs will be switched in every three minutes.

A 2m FM CWID will be on 144.340 mhz continuously.

The balloon will be a 5 ft radiosonde balloon of the type used by the National Weather Service.

The net on 7155 khz will be hosted by Ralph Wallio W0RPK.

The balloon will be launched 15 miles West of Champaign, IL near White Heath, ILThe package is expected to go down range 80 miles. The balloons transmitters should have a range of about 425 miles when they reach the 100,000 ft altitude.

> papers and a book written in Germany that has comprehensive reviews of many
> radios.

Several receivers are reviewed in "Radio Receiver - Chance
or Choice," and its supplement "More Radio Receiver - Chance
or Choice," both books written by Rainer Lichte, and published
by Gilfer Associates, Inc. (Park Ridge, NJ).

Another book of interest is "The Buyer's Guide to Amateur
Radio - A personal choice," by Angus McKenzie, G3OSS, published
by the Radio Society of Great Britain. It is available from the ARRL,
225 Main St., Newington, CT 06111.

These books do not review the three receivers you mentioned.

The Racal RA-6790/GM was reviewed in the 1982 edition of
the "World Radio TV Handbook."

I LOVE IT! Finally, a radio for the ham market with a built-in blab-off
timer to cure those latch-to-talk long-winded old farts!

Now if we could just get the dealers to attach some temperature-sensitive
plastique so the thing would blow up instead of just getting too hot to
hold....

I have recently bought the David Clark H10-20 aviation
headset. Has anyone had any experience in using this
type of headset for ham use, ie. building an adapter for
use with handy talkies or HF gear?
Thank you.
Arun WC6V

**** UoSAT-OSCAR-11 BULLETIN - 199 06 October 1989 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT-1 (UO-9) COMPLETES 8 YEARS IN ORBIT **

UoSAT-1 has just passed its eighth birthday! Falling into the Earth's atmosphere at a rate of several kilometres each day, UO-9 is expected to burn up in the next week or so. The spacecraft is still operational, sending back telemetry and experiment data as it descends to a fiery death!

Launched at 11:27 GMT on 6th October 1981 by NASA on a DELTA 2310 rocket into a 554 km, polar Earth orbit, UO-9 carried a pioneering range of amateur radio, technology demonstration and educational payloads.
Travelling at 7 kilometres per second, UO-9 has made over 44,600 orbits of the Earth - approximately 2,000 million kilometres or the equivalent of 10 return journeys to the Sun! During that time, the UoSAT Mission Control Groundstation at Surrey has received around 12 Giga-bits of telemetry and experiment data from the satellite.

UO-9 has involved the direct participation of several thousand experimenters in more than 40 countries world-wide: from space agencies to university groups, college students, school children and radio amateurs. It was the

first satellite to carry a digital voice synthesiser transmitting on amateur radio frequencies enabling reception of 'spoken' telemetry data using very simple and inexpensive hand-held equipment. UO-9 also pioneered the use of digital data transmission compatible with readily available personal or 'home' computers - now taken for granted, but an age only dawning at launch eight years ago!

UoSAT-1 has received widespread attention and publicity in the form of over 80 papers, publications & conference proceedings and considerable media coverage on TV, radio and press. It paved the way for its sister craft, UoSAT-2, and two new satellites (UoSAT-D & E) waiting to be launched on ARIANE shortly.

In the last days of UoSAT-1's life, the spacecraft has been programmed to transmit telemetry and WOD data continuously in order to provide the maximum data during its final moments - it will carry no bulletins or Digitalker messages. Please monitor UO-9 during its re-entry and send any interesting data to UoSAT. Watch UO-11 for news.

From all of us at UoSAT and the many experimenters world-wide:

HAPPY BIRTHDAY UoSAT-1.

THANKS FOR EIGHT YEARS AND FAREWELL!

** UoSAT-D & E **

The launch of the UoSAT-D & E spacecraft has been postponed for several weeks whilst a problem with the ARIANE launcher electronics is resolved. The spacecraft are in the UoSAT Cleanroom undergoing exhaustive tests and calibration, whilst awaiting news of a new launch date.

** $BID **

Please use BID $UOSAT.199 for PR BBS use.

Regarding "what are standard DXpedition freqs", I just called
K7SS, who is putting together the PTI operation, and he says
that these are generally 25 KHz or so above the bottom of each
band for CW, and for phone, 3.795, 7.195, 14.195, 21.295 and
28.495 MHz. These are approximate.

Regarding the Puyallup tribe sales of unlicensed liquor, gambling
and fireworks, they have been doing these things for a long time.
I think the govt's legal challenges for these ended after
N6RL left the northwest 15 years ago.

The Navajo tribe may count also. If you think it should count, do
some research like N7ZZ and friends did and make application!

As far as rule 3 or 4 ruling out monuments, it does not mention
Indian land.

I understand that the application, which I have not seen, is based
upon, among other things, the Medicine Creek Treaty which gave
settlers permission to use the Indian land. What really got this
thing going was several statements by governor Gardner affirming
soveriegnty of the Puyallups recently. Should be interesting to
see how this unfolds.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

SpaceNews

MONDAY OCTOBER 9, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* SHUTTLE NEWS *

The earliest possible launch window for STS-34 opens at 1:29 PM Eastern Time (1729 UTC) on Thursday, October 12th.

* WA3NAN INFORMATION *

The Goddard Amateur Radio Club station WA3NAN in Greenbelt, Maryland is expected to be active during Space Shuttle mission STS-34, transmitting live air-to-ground communications on the Amateur Radio bands. The approximate operation schedule is as follows:

3.860 MHz (2200-1400 UTC)
7.185 MHz (1200-2200 UTC)
14.295 MHz (Primary frequency)
21.395 MHz (As needed)
28.650 MHz (As needed)
147.450 MHz (FM Simplex)
439.250 MHz (Amateur television, ATV)

This is not a strict schedule. Listen to the Shuttle rebroadcasts for updates. In addition to providing a source of Space Shuttle audio for Amateur Radio operators, WA3NAN also provides the following services:

1) Descriptions of the on-board payloads and flight experiments
2) Profiles of the astronauts on-board the Shuttle
3) Shuttle orbital data which allows listeners with special orbital prediction programs to track the Shuttle
4) Night-time Shuttle rise and set times for various locations for those who wish to see the Shuttle fly overhead.

* MICROSAT NEWS *

Arianespace has found a problem with the pyro initiators of the Ariane 4 third stage of missions V34, V35 and V36. This problem will cause at least a one month delay in the launch of SPOT-2, along with the MicroSats and UoSATs.

* OSCAR-9 NEWS *

UoSAT-1 has just passed its eighth birthday! Falling into the Earth's atmosphere at a rate of several kilometers each day, UO-9 is expected to burn up in the next week or so. The spacecraft is still operational, sending back telemetry and experiment data as it descends to a fiery death!

Launched at 11:27 GMT on 6th October 1981 by NASA on a DELTA 2310 rocket into a 554 km, polar Earth orbit, UO-9 carried a pioneering range of amateur radio, technology demonstration and educational payloads.
Travelling at 7 kilometers per second, UO-9 has made over 44,600 orbits of the Earth - approximately 2,000 million kilometers or the equivalent of 10 return journeys to the Sun! During that time, the UoSAT Mission Control ground station at Surrey has received around 12 Giga-bits of telemetry and experiment data from the satellite.

UO-9 has involved the direct participation of several thousand experimenters in more than 40 countries world-wide: from space agencies to university groups, college students, school children and radio amateurs. It was the first satellite to carry a digital voice synthesizer transmitting on amateur radio frequencies enabling reception of "spoken" telemetry data using very simple and inexpensive hand-held equipment. UO-9 also pioneered the use of digital data transmission compatible with readily available personal or "home" computers - now taken for granted, but an age only dawning at launch eight years ago!

UoSAT-1 has received widespread attention and publicity in the form of over 80 papers, publications & conference proceedings and considerable media coverage on TV, radio and press. It paved the way for its sister craft, UoSAT-2, and two new satellites (UoSAT-D & E) waiting to be launched on ARIANE shortly.

In the last days of UoSAT-1's life, the spacecraft has been programmed to transmit telemetry and WOD data continuously in order to provide the maximum data during its final moments. It will carry no bulletins or Digitalker messages. Please monitor UO-9 during its re-entry and send any interesting data to UoSAT mission control.

* OSCAR-13 SCHEDULE *

AO-13 Operating Schedule
16Aug89 until 16Nov89
BLON/BLAT 210/0

>consider how few instances of such happenings are commonplace in the Class D
>Service.

I thank-you for your complement, but as for instances of this happening not being commonplace I will have to disagree with you. At least here in Marquette. Granted we are a small community (30,000 people and the largest city in the Upper Peninsula of Michigan) I have handled this type of call about five times in the last three years. Not to mention about three to five motorist assist calls a week. We do not have a REACT group here but there are a few of use that do listen to 27.065 (ch. 9) and handle a few calls. I have not heard near as many (I can count only one) on 2 meters in the same time period.

Of course when it comes to things like hurricanes and such HAM operators are in their field. But for local traffic, I think one will find more people looking for help on 11 meters than anywhere else.

>Now think about the millions of inconsiderate operators that make up
>the majority of the C.B. users and I think you'll understand why both the FCC
>and the Amateur community are quite against ANY expansion of the Class D CB
>Service. If people had to have a license, and hence were bound to follow the
>rules (as laid out in Part 95) C.B. would be a lot more useful

As for inconsiderate operators yes I will have to agree with you there are more than our share found on and around 11 meters, but, being an avid scanner and shortwave listener I have also found many people that act the same way on other parts of the radio spectrum. This includes but is not limited to 2 meters, 20 meters, 40 meters and 80 meters. And as of making up a majority of the C.B. users. Isn't this kind of a blanket statement? Now I can't speak for any place but around where I live, but I would think that we are about average with the rest of the country. There are about 100 operaters around the Marquette area that use 11 meters regularly. And of this group I would say there are eight people that are a real nuisance on the radio. That makes it about ten percent. Not bad. Not good, but not bad. Perhaps in the larger cities there are more than this but all in

all I would think about the same. Percentage wise.

About the Part 95 low and behold C.B. opperators are suppose to follow these rules, weather they do or do not is their choice. I try to run a clean station and that is all I can worry about. There is little inforcment of the rules this much is true.

> You (and your youthful commarades) might consider joining the ranks of the
>Amateur community, it's just such people as yourselves that can benefit the
>Public Service aspects of this hobby the most...and that's the long and short
>of it. '73!

Join? No I would think not. Thanks for the offer but I have chosen not to join the ranks of the HAM as so many of them I meet look down the nose at people like myself. Also there is a second reason that being a small protest of the archaic rule of needing to learn code. To me that is the same as saying:

"Sorry you can't run a computer let alone own one untill you learn (INSERT YOUR LEAST FAVORITE PROGRAMING LANGUAGE HERE) first."

The OSCAR-9 satellite (UOSAT-1) is getting close to re-entry. I'd like to ask anyone who is updating parameters on a day-by-day basis based on their own observations to post their latest parameter set, in whatever format, even if incomplete. With the satellite as low as it is, the standard sources of orbital data are obsolete before they're disseminated.

At present my own calculations are too crude to say other than that at 02Z on Oct 8, O-9 is still transmitting and that its period appears to have dropped below 89 mins.

[Our usenet feed has been irregular the past week; my apologies if information of the type I'm requesting has already been posted.]

Source record: 16467

I go this information at Pacificon in San Jose this weekend:
There will be a communications excercise conducted by McClellan AFB from 10:30 AM Saturday 14 October and ending 10:30 AM Sunday 15 October. The times are PDT, I assume.
Exercise Patriot Signal will use frequencies of 6.72 MHz, and 11.45 MHz, and scenarios will include a massive earthquake, terrorist attacks, and a hurricane warning for the Gulf Coast. This is an EXCERCISE. It ought to be interesting listening, but incidents reported are not real.

This information comes from a PAO at McClellan.

Also, in answer to my own question regards the Kenwood BBS:
The number is 213-761-8284 2400 8-1-N 5PM-8AM M-F 24 hours weekends and holidays. This is a trial, so this may change. For more information contact Wayne Yoshida 213-639-4200.

Contact K8IHY in Byron Center, MI (just south of Grand Rapids). He has
a small business modifying these headsets for use with any radio in
conjunction with a tape player. You can use it for your aircraft radio,
your HT, an HF rig, etc. One channel has priority, and when the squelch
opens on that channel, the tape player cuts out. Stereo, and quite
HI-FI also.

We were told once upon a time that high power and high gain antennas were undesireable in the cellular telephone context because of the risk of extending range too far beyond the limits of one's own "cell". I take it then that this is not borne out by experience?

The switch compensates for varying propagation by raising
and lowering YOUR power via the control channel. When you are
solid enough into a site, it backs your power off.

Of course, if you are half a mile away, and have a 96 element
array pointed down the cell throat, it may not be able
compensate far enough. Of course, the opposite is also true.

> master and request transient moorage, but, if you want to chat, get on the
> CB or your ham rig (if you're licensed, and you *should* be :-)).

So the Marine Service is not for ship-to-land communications except for certain land station specifically licensed for land operation in the Marine Service? I see in movies and TV shows lots of ship-to-land communications. Are they showing you "illegal" radio use, or is it the case that a land station Marine license is not that hard to get? CB is essentially useless for so many things and the hams are still wanting everyone to learn how to DX the world on Morse Code to get a ham license, so what are people to use?

> It'll cost you about 20 bucks, but a good volume would be "47 CFR, Parts
> 80 to end". Read Part 80 and understand all applicable rules. There are
> lots of things you won't care about, however. Then turn to Part 97 and
> read about Amateur Radio and think about getting your license (hint, hint).

You better talk them into getting interested in what certain hams think all hams do (i.e. DX the world in Morse Code) or otherwise lots of prospective hams will balk at the (in their mind, silly) Morse Code requirement for every possible ham license.

3150. Re: HAM ballon launch - Oct 7th?

Newsgroup: rec.ham-radio
Date: 1989-10-09 00:39:33 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500221@ux1.cso.uiuc.edu>
Source record: 16475

The Illinois ATV balloon launch went off quite successfully.

Early computer problems delayed the flight for approximately 2 hours.
Due to the cold ground weather, the in-package computer failed to
function properly. The specific cause was not located, but after warming
the package with a heat gun, it began operating. The package was black
to acquire solar heat during it journey in the much colder upper air.

The launch took place around 11:30 AM CDT. Due to high winds at the time
the package struck the ground once just after it was released, bending one
of the UHF antenna loops. It was also suspected that the mirror that gave
the ground images to the camera was damaged at this time.

The mirror did continue to function during the first half of the flight
allowing alternating ground and horizon views. By mid flight it was
obvious the mirror had some troubles, and it eventually was stuck in the
down position giving a permanent ground view.

The package landed about 4 miles east-south-east of Lebanon Indiana, about
25 miles north of Indianapolis. N9FWB (who was equipped with DF capability
on both 2m and 70cm) spotted the package about 40 feet off a country road
in a bean field. The external temperature probe was broken off, and the
camera mirror was broken loose, but still dangling on. The package can be
easily made reusable and is now back in the hands of WB8ELK.

I personally had a lot of fun just following the chasers, but recognize that
even more fun could be had with actual direction finding capability. This is
definitely something many people may find fun to do, even if there is no
TV picture, or even if it is not a balloon launch. Other direction finding
activities should also be very enjoyable for group or club activities. Give
it a try.

In metropolitan areas where several adjacent cells exist, it might be a
problem. In isolated areas where one cell has not actual adjacent cells,
I don't see physical problems developing with it as quickly. Maybe you
could say that by adding gain, you might get into an adjacent cell that
you don't want to get into. I don't know how the cellular systems hands
off the call as you move from one cell to another, but with added gain
you might find these things happening much more often.

Ron Parise, WA4SIR has provided the following information on his flight aboard the Shuttle on STS-35 as a Payload Specialist for the ASTRO experiment. Ron is hoping to carry the SAREX (Shuttle Amateur Radio EXperiment) Packet radio hardware with him.

Howdy folks!

Here are a set of prelaunch predicts for STS-35. They might change slightly prior to launch due to some new ascent performance predictions but not by much. These should do fine for any planning excercises you might wish to do. Also feel free to publish, E-mail, or otherwise scatter these numbers far and wide to get people started thinking about the mission. These are preliminary and are NOT yet official. By the way, our launch time is now April 26, 1990 at 05:02 GMT.

Satellite: STS-35
Epoch time: 90116.2398947
Element set: Prelaunch
Inclination: 28.4614 deg
RA of node: 121.1687 deg
Eccentricity: .0000811
Arg of perigee: 318.7728 deg
Mean anomaly: 283.2833 deg
Mean motion: 15.75083130 rev/day
Decay rate: 0.00000 rev/day^2
Epoch rev: 01
Semi Major Axis: 6736.21 Km

3154. Does It Matter How Thick Antenna Wire Is?

Newsgroup: rec.ham-radio
Date: 1989-10-09 05:34:41 UTC
From: forrest@sybase.com
Message-ID: <6489@sybase.sybase.com>
Source record: 16384

I'm in the process of putting up an inverted V. I had been planning
on using some wire that I had laying around but I started wondering
if the thinkness of the antenna wire makes any difference. I'm
only going to run barefoot using an IC-730 so conderations relating
to high power operations don't matter. Neither to considerations
relating to weather. Does frequency matter? Does anything else
matter. Is there any size of copper wire that shouldn't be used?

Thanks,

**********Relayed From the N6AFU BBS Los Gringos, CA**********

ANNOUNCING A NEW DX CONTEST CATEGORY

Given the proliferation of new DXCC coutries, the ARRL has decided to create
a more challenging category to the annual Phone and CW DX contests.

New Category: SETI
Power Limitations: None
Band Limits: > 30 MHz
Exchange: Contest exchange must include prime-based raster scan, alphabet,
and intermediate dictionary. Remarks must be limited to those of
a personal nature, not including health matters or flatulence, or
recordings of Carl Sagen.
Multiplier: 10E6 per intragalactic contact; 10E12 for extragalactics. A
special one - time bonus of 10E18 will be awared for First Contact
with pan - dimensional beings.
Penalties: Penalties will be extracted for offending extraterrestrials, and
any subsequent invasion will result in immediate disqualification.
Restrictions: Communications must be provably electromagnetic, with automatic
disqualification for mediums, channels, and Shirley Maclaine.

If the interest was in an "early warning" device for Auroral activity, a simpler option is WWV. WWV includes a solar activity report in, in voice, the 18th minute of every hour.

From: benk@inmet
Message-ID: <13700002@inmet>
Source record: 16411

To the best of my knowledge, KCBI is off the air, and has been for months. If I'm not mistaken, I recall having heard of the shut-down of this station in one of Glenn Hauser's programs ("World of Radio" or his segment in Radio Candaa International's "Shortwave Listener's Digest"), or in his newsletter, "DX Listening News".

KCBI was part of (or affiliated with) the Criswell Bible Institute (hence the callsign) in Dallas, Texas. I can recall having heard it relaying the programming of a local Dallas FM station (also part of the C.B.I.). So, if you are really curious about this station, you could always try to get hold of the chief engineer by calling up the C.B.I. I would be happy to post the last known official address of KCBI and the callsign of the FM affiliate, if this will help in tracking down information.

One interesting question about this station is: who might try to get hold of its S.W. broadcast license (not to mention equipment). I can imagine that there is no small waiting line for FCC SWBC licenses. Anybody have any information?

BTW, the last time I received this station was in April/May of 1988.

3159. Extended xmit mod for the Icom IC-u2AT handheld

Newsgroup: rec.ham-radio
Date: 1989-10-09 13:37:06 UTC
From: rfc@briar.philips.com
Message-ID: <65217@philabs.Philips.Com>
Source record: 16389

Extended TX mod for the Icom IC-u2AT

This mod will extend the transmit range of the u2AT from 139 Mhz to
about 161 Mhz (maybe further if you adjust the PLL). You'll be working
with a surface mount PCB, so you will need a fine point soldering iron
and a very steady hand. And you will need one diode, like a 1N914, or
a tinyier one if you can get it.

You must have the service manual to help you identify where the new diode is
to go. Review all the below with the manual before you reach for your
screwdriver and soldering iron!

>remove the battery pack.
>remove 4 screws that hold the sliding guide that the battery pack mounts on.
This is the piece of metal that frames the PL tone switches.
>remove the sliding guide. Be careful that you don't lose the battery release
button.
>there's a screw on the left side of the HT just below the light switch.
Remove it.
>CAREFULLY pry the front panel up. There's speaker wires AND a flexable lead
that goes to the front panel.
>There's a shielded PCB that these leads run to. Carefully pry this up. It
will then fold down. There's several flexable leads at the bottom.
>You should see the CPU now.
With the manual, locate where D113, D119, Q131 are.
>Where the new diode goes is not marked in the diagram of the CPU PCB. Locate
the anodes of D119. This land connects to pin 27 of the CPU chip ic101.
Locate the cathode of D113. This land connects to pin 20 of the CPU chip.
These diodes are SMDs, and do not look like what you'd expect diodes to look
like.
>In the area between Q131, D119, D113, and the CPU chip, you should see
a set of 3 solder pads that form a trianglular pattern that would accept a 3
legged SMD, like the neighboring diodes and transistors. One of these pads
connects to the anodes of D119. The new diode's anode goes to this pad.
Another pad connects to the cathode of D113. The cathode of the new diode
goes here. This means that the new diode cathode will connect to pin 20 of
the CPU, and that the anode will connect to pin 27 of the CPU.
>Carefully prepare the diode leads to line up with the proper pads, and take
care that when you solder it on, you don't short to something. Also, take
anti-static precautions. I used a bit of double-sticky-foam tape to hold the
diode in place when I soldered it. And I left the tape to help keep it in
place after I was done. Be sure that you will be able to replace the PCB you
pried up, without it touching the diode.
>Reassemble the rig.
>Do a CPU reset. That is: Turn the power on while holding the light switch

down.
>You should be able to xmit between 139 to about 160 Mhz. You could tweak the PLL to extend it further, but I didn't do this. The xmit power will be lower on the higher freqs.

Disclaimers: Be sure to have the proper permits for out of band operations. And, do this mod at your own risk! WA2ISE

3160. News about KJES?

Newsgroup: rec.ham-radio
Date: 1989-10-09 13:43:00 UTC
From: benk@inmet
Message-ID: <13700003@inmet>
Source record: 16412

Does anyone have any news or information about radio station KJES?
There were many reports of reception of this (new) SWBC station (based in
New Mexico near the Texas border) when it carried out test transmissions
in the first few months of 1989. Since then, there hasn't been a peep,
either on the airwaves or in the SWBC bulletins to which I subscribe.

Thanks.

From: MEHARP01@ULKYVM.BITNET
Message-ID: <8910100705.AA06343@ucbvax.Berkeley.EDU>
Source record: 16409

I think the idea of a Winter Field Day is a good one. I never work the summer Field Day because it's always really hot here that time of year. Between the heat and insects, it's not much fun. Having the event between Christmas and New Year's would be good for me because I am always off that week (as are most people in academia.)

Let's bounce this off the ARRL. As far as EMAIL to ARRL goes, they SHOULD get a real "acknowledged" UUCP feed. I have a feeling they will fight that at all costs. EMAIL is a lot harder to ignore than USPS mail.

Count my vote "for" Winter Field Day....

3162. Ham-Fest in Syracuse 10/14/89

Newsgroup: rec.ham-radio
Date: 1989-10-09 14:28:00 UTC
From: benk@inmet
Message-ID: <13700004@inmet>
Source record: 16410

In yesterday's (8 October 1989) "Shortwave Listener's Digest" program on Radio Canada International, the host, Ian MacFarland mentioned that a Ham-Fest will be held in Syracuse, New York on 14 October 1989 (next Saturday) from 9:00 a.m. to 5:00 p.m.

The Ham-Fest will include events of interest to shortwave listeners as well as radio amateurs, including presentations on Radio Canada International, Radio Japan, Deutsche Welle, and the BBC. Mr. MacFarland said that he'd be attending the Ham-Fest, and urged people visiting to stop by an introduce themselves.

It was announced that you can call 315-469-0590, after 2000 hours UTC, for more information on the Ham-Fest.

3163. CALL FOR VOTES: Rec.Radio.Shortwave (rec.swl)

Newsgroup: rec.ham-radio
Date: 1989-10-09 14:47:42 UTC
From: rshapiro@BBN.COM
Message-ID: <46667@bbn.COM>
Source record: 16381
Cross-posted to: news.announce.newgroups,news.groups,rec.ham-radio

This is a formal call for votes for the proposed group
REC.RADIO.SHORTWAVE (originally rec.swl).

Purpose: to discuss all issues of interest to short wave listeners,
i.e. those who are interested in listening to programs on the
shortwave broadcast bands. Topics will include, but not be limited to,
program schedules, program recommendations, receiver reviews, dx news,
the politics of international broadcasting, information about
periodicals of interest, tips for improved reception, pirate and
clandestine station information, etc.

This group will also welcome articles on dx'ing other broadcast bands
(lw, mw, vhf-fm & tv), and on shortwave listening of non-broadcast
stations.

It is expected that this newsgroup will be gateway'd to the swl-l
mailing list (though a few details remain to be worked out).

Voting procedure:

Send all votes to RSHAPIRO@BBN.COM (if you use 'r', please verify the
address). Include the words "rec.radio.shortwave: yes" or
rec.radio.shortwave: no" in the subject field. Voting begins
10-October and runs through 10-November. I do not plan to acknowledge
each vote, but I will post a list in about two weeks (addresses only).
A second call for votes will go out at about the same time. As soon
as possible after the closing date, I will post the final results of
the vote. Following current usenet practice, the proposal requires 100
more 'yes' votes than 'no' votes in order to pass.

PLEASE DO NOT POST VOTES. Be careful about this -- not only will your
vote not count, but it will generate angry hate-mail from readers who
are sick of seeing these things. Even if your email'd vote bounces, DO
NOT POST.

Any votes which were sent to me during the discussion period do not
count -- please re-submit them within the designated 30-day period.

Richard Shapiro
rshapiro@bbn.com (internet)

> ...

Excuse my naivete, but what are the chances that this payload's landing
would injure someone? I know that the midwest is mostly farmland, but
Chicago was not too far off from the launch site, as was Indianapolis,
and this thing landing in the middle of a busy freeway could cause a major
fender-bender.

What precautions are taken to avoid such an incident?

3166. 9:1 or 10:1 balun for T2FD SW antenna in 89 WRTH

Newsgroup: rec.ham-radio
Date: 1989-10-09 15:53:06 UTC
From: bakken@arizona.edu
Message-ID: <14616@megaron.arizona.edu>
Source record: 16392

I am planning on constructing the terminated, tilted, folded
dipole (T2FD) antenna, as described in the 1989 World Radio TV
Handbook (WRTH), for shortwave listening. However, I have a
few questions about it. The plans specify a 10:1 balun transformer
(the antenna is at 500 ohms and the coax at 50). I have been unable
to find a 10:1 balun in Arizona, but the book says that a 9:1, which
I have found in the US, should work. So that leads to the following
questions:

1) Would the 9:1 give any worse performance? I will probably start
out with an old military receiver and get a Sony 2010 or a Grundig
Sattelit 500 within six months. I don't care about DXing for the
sake of it, just to listen to news and cultural broadcasts from
medium and strong stations from different places in the world.

2) Does anyone know of any 10:1s available by mail order in the US?

3) I've heard it is pretty easy to build such a transformer. I have
a little electronic background (I can solder), so would it be much
hassle for me to build one (how long would it take me?). Would my
end product be sturdy?

Thanks a lot! Please *email* me, since this is a ham newsgroup, and
I'll post a summary if there is sufficient interest and email
summaries to interested parties if there is insufficient interest
to post.

3167. Summary: "DXpedition" to Macau (XX9SW)

Newsgroup: rec.ham-radio
Date: 1989-10-09 16:08:09 UTC
From: wheatley@cbnewsk.ATT.COM
Message-ID: <1170@cbnewsk.ATT.COM>
Source record: 16393

Well, had a couple requests, so here is a quick and dirty summary of my recent operation from Macau. First, I operated from Macau as XX9SW over three weekends: 8/25-8/27, 9/23-9/24 and 9/29-10/2. Secondly, I apologize for the intermittent RTTY operation during the contest weekend. After about 3 hours into the contest, Murphy found his way into the computer, and essentially killed any hope of operating the contest effectively.

I ran roughly 2800 contacts the first weekend, and somewhere around 4500 contacts the following two weekends. Most were ssb, although the second two weekends had about 2000 CW qsos and 400 RTTY contacts.

Licensing isn't easy in Macau. The license form requires all statements to be written in Portuguese. Secondly, once that is over, it requires about $30 US for a 30 day license! Not sure having your own call is worth it, especially as I go home every evening and find the mailbox stuffed with cards!

A XX9 call is sure to generate a pileup wherever you go; being a relative "novice" to dxpeditions and operating from the other end of a pileup, I found this to be a bit nerve-wracking! Next time, I suspect my QSO count will be higher, as I now have a tolerance for the horrendous noise. Pileups were surprisingly civil, especially after hearing what they sound like from the US side of one. They were orderly, and I found running on the same frequency, as opposed to running split, usually worked OK. The only bad time I had was working 10 meters into Europe. The propagation was fantastic, but so was the pileup, and I sensed a bit of desparation on some of the operators parts...seemed that this was the first, and felt to be the last time they could work XX9 on 10 meters. All in all, my compliments go to all the operators that i worked, or that tried to work me. Seems that the pileups were a whole lot better than I expected.

Thats about it for a summary. If anyone has any questions, please drop me a line. I also know the ropes on licensing in Hong Kong (KU9C/VS6) so if you plan to go to Hong Kong, take 2 meters along and get your license. Its good for a year, takes a short time, and costs about $20 US. By the way, I hope (job permitting) to operate from XX9 again, next year. At the very least, I plan to burn off some of the frequent flier miles to head there for a contest weekend. ALso, for the Europeans, I plan to take a better 40/80 meter antenna arrangement....I worked into Europe and the US on 40 this trip, but it was tough!

> a little on the typical range of the phones?

I believe that the rules for cellular phones state that the maximum permissible output is 3 Watts ERP, where ERP = output power x antenna gain. There would, then, be a very subtle difference in the style of antenna used, with the apparent advantage, in fact, going to the low gain, more omnidirectional antenna. If the limiting performance factor were the ability of the mobiles to hear the cell site, then there would be a use for a gain antenna, but I believe the cell sites use significantly more power than the mobiles do.

I've been using version 2.0 on a trial basis here for about a month,
and it seems to work very well, based upon a "stations heard" analysis.
I had some concerns about the speed when I read the documentation, but
it only takes a few seconds to crank out a point-to-point prediction
on a 10 MHz AT clone with no math processor.
BTW, I downloaded it from a ham-related phone bbs, and version 2.0,
at least, is shareware. I plan to buy in.

Bill, you forgot to mention the kinds of wind we have up here.
I don't know if Ft. Collins has the same kinds of winds Boulder does,
but I'd bet they get close. 60mph winds are not an uncommon thing up here
(thinking in terms of a timeframe of a year or so).

And I've lived here 2 years and seen 100 mph winds reported in Boulder.
(I think it was 100, anyway. Once you get above 60, whats a few MPH
among winds? :-)

Of course, the air is less dense here than on the coast, so 100mph winds
don't do quite as much damage to buildings (and antennas :-) as it does
at lower elevations, but 100mph is 100 mph :-)

From: andreask@watson.bcm.tmc.edu
Message-ID: <1747@gazette.bcm.tmc.edu>
Source record: 16390

To all TRUE (in spirit and in practice) hams:

*** The thoughts I am expressing below are NOT flames at all ****

I have seriouly considered joining the ranks of hams for the last couple
of months so I joined this newsgroup to find out what really goes around
in the ham world. Unfortunately I was disappointed and I am reconsidering

Most of the discussions were about hams operating in a NON-civilized manner
or about discussions on whether non-hams should be allowed to buy ham
equipment or not. Hey guys what happened to the hard core HAMS that discuss
design problems. What happened to HAMS that build their own stations ? What
happened to HAMS that support and encourage the uninitiated, like me, to get ithe game ?
As a person that spent almost half of my life studying electronics I think
the pleasure of only talking to HAMS around me is only half the game. I derive
as much satisfaction from building stations as well as using them. Is it
against the law, nowadays, for hams to build their own stations ??

Can somebody, please, give me some incentive for joining ? I am NOT
discouraged but I AM disappointed.

Thanks

>I'm in the process of putting up an inverted V. I had been planning
>on using some wire that I had laying around but I started wondering
>if the thinkness of the antenna wire makes any difference. I'm

The thickness of the wire will mainly effect the efficiency of the antenna.
The ohmic resistance (is that a tautology) of the wire will chew up the
power that would otherwise have gone into the radiation resistance (i.e.
useful power).

Bandwidth is also related to the thickness of the antenna, but unless the
ratio of length to diameter is less than 10 (which at hf is usually
acheived by using a cage of wires rather than one conductor), it can
be treated as the regular narrowband dipole.

Basically just make sure your ohmic losses are low compared to the radiation
resistance, (On very short antennas this might be only an ohm or two) and
its strong enough not to stretch much or break under tension.

>headset. Has anyone had any experience in using this
^^^^^^^^
Do you mean a headset that has a boom-type mike mounted to it? Or is it
a headphone set (no mike).

I don't have my Sporty's Catalog handy, but if I remember right, the
H10-20 is a headphone only set.

DC (David Clark) uses pretty much standard wiring on the headphone plugs and
a standard 1/4" mono plug.

I don't remember what the resistance is, but there is a way to find out
if you don't have the paperwork on the set around.

Put the headset on and grab your favorite multitester. Set the tester so
that it will read at least 10 ohms of resistance. Take the probes from the
tester and place the ground probe on the bottom pole of the plug from the
headseat. Then take the live wire and place it on the other pole. If you
head a little static and get a resistance reading > 0 you hit the right one.
If you don't, try the other pole.

The DC headsets contain a little volume adjustment knob on one of the domes.
While you are metering the resistance, turn this knob, first all one way, and
then the other. That way, you will get the minimum and maximum resistance
from the headphones.

If this is a headset with a boom mike, things get a little more complicated.

DC uses 2 different types of mikes. One is a amplified dynamic mike and
the other is an electrect mike. The dynamic mike is a big black round
mike on the end of the boom, and the electrect mike is a little green
thing.

I don't remember, but one of them requires some bias voltage be supplied
by the aircraft's radio system. I remember looking at all this one time
when I was comtemplating building a portable intercom for use when flying.

I know the things are real simple, but I couldn't find any plans. About
10 bucks in parts should do it.

BTW, if any of you kind hams out there have plans for such a critter,
please mail them to address in the signature block (if you could be so
kind and don't mind). I am really looking for a 4 position intercom.

Anyway back to the mike. All the headsets I have seen have 2 different
size plugs on them. A 1/4" plug for the headphones, and a .308" plug

for the mike. Any good avionics shop or FBO (Fixed Base Operator) that has a maintenance shop should have them in stock or be able to get some for you.

Of course, military headsets have only 1 plug that combines all the leads for mike and headphones. And the impedence for is different than the DC headsets.

I really like the quality of DC headsets. I have 2 of them, both H10-40s and use them all the time while flying.

3177. usenet un-net on 10M last saturday

Newsgroup: rec.ham-radio
Date: 1989-10-09 22:24:26 UTC
From: rusty@cadnetix.COM
Message-ID: <9778@cadnetix.COM>
Source record: 16400

Well, I'm sure glad that last Saturday was not my first day on 10m,
I would have hung up the radio for good.

It started off at 1500Z with an incredible number of off-shore
stations coming in quite well (France, England, Holland as a small
example), and with me spending the first hour trying to reply to
some. Ha! One time, since I was able to hear the east coast
stations calling the offshore station, I heard what the poor
guy on the other end must hear and decided that I had no chance
with only a dipole and 100 watts, so at 1600z I gave up and
tried to find a quiet slice of band to call cq on.

No such animal. As it turned out, the California DX party
(you call *that* a party? No thanks) was in full swing, and
the entire band was blasting away. Even if I could find a section
of the band to carve out, I usually found someone right next to
me trying to reach one of those rare DX stations and splattering
on me enough I could not continue where I was. I suppose
I should be happy that I made one contact the first hour
and 4 the next.

But it was not nearly as fun as the other days. Oh, well,
as long as there is not another DX party this Saturday maybe
I'll enjoy it again.

(And I've only got 2 states toward usenet WAS - NJ and NY.
(WA2ILB and K2ILH - unless I've missed someone) (And I promise
to get QSL cards out as soon as I have some to send!))

Looking forward to next Saturday, and hoping my rig starts
working well again....

> Also, on the subject of solar power, I saw in the Edmund's
> Scientific catalog a portable 12vdc solar pack.

Edmund's is sometimes overly expensive, sometimes not.

> The 12.5A version was over $400.00!!

well, remember that this is a system which will supply 12.5 A more or
less continuously. Which is a pretty good trick, and also most likely
a more power than you need if you are doing QRP off of the solar array.

> It seems awfully expensive to me ...

Yup, big solar arrays tend to be expensive.

> mountains and streams/rivers....I was leaning towards car
> alternators with paddle-wheels in a wooden frame to just set
> in the stream for charging batteries.

Be aware that you need to get the alternator spinning at a pretty good
rate of speed in order to get any power out of it (2000rpm comes to
mind, but this is just a guestimate of a number I never really learned
about 4 years ago when I should have learned it (yah - hows that for
obtuse?)). Also, most people do not realize how much power you lose
in belts, if you choose to use a belt-driven scheme. You can lose
40 watts in the mechanics alone using a belt. If you adjust the
belt too tightly, expect that to jump to 100 watts or more! These
numbers are within a few percent of the actual numbers we were
dealing with back when I was working on a alternator-based
exercise bike. You might be surprised how much difference there
is between different alternators, too. I don't remember
the specific numbers, but it can make a considerable difference
in your power output which alternator you use.

As far as the actual amount of power you can get out of a stream,
I've tried many times and many methods to get a reasonable answer
to the question of how much power is really available, and each
method I use gives me a totally different number, with the range
from high estimate to low estimate being something on the order of
1000x.

A friend of mine and I had built a water wheel, and I had designed
a water motor, but we never got around to sticking the bearings
and all onto the base. Maybe one of these days....

Another friend of mine seems to think that a good wind-based scheme
would beat water hands down,but he has yet to convince me completely...

> Goin' for it on FD.....de KM4JN

I'd be very interested in your results. Keep us all informed, please!

Anyone have any real numbers/answers/experience for/to/with all this?

>If CBers were serious about getting a bigger allocation
>it would behoove them to push the Government for better policing of Part 95
>violations, and the reinstituion of licensing. Period.

Better yet, a little self-policing might be in order for 11-meter users.
Never depend on the Government to do a job you can do yourself. Class D
can gain spectrum by showing its public service potential and cleaning
up its act. Here is what the Ham community does:

o Make sure you follow the letter and spirit of the regs.
o Don't talk to LIDS (poor operators).
o Report violators of Part 95.
o Do something positive with the resources you are given.

Usually works, but not always.

::::::::::::::::::::::::::::::::::
:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2063--Oct. 3, 1989 ::
::::::::::::::::::::::::::::::::::

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Agnes Carbon.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2063

-------------------------------------------------------------------------------

PUBLICATIONS--Edition 4.2 of Radio Sweden's "Communications in Space: The
DXers Guide to the Galaxy" is now available free of charge from Radio Sweden.
This 13 page publication covers satellite radio and television, weather and
other "utility" utility satellites, amateur radio in space, and the American
and Soviet space programs.

We're still updating our book "The DXers Guide to Computing", and edition 4
is still several months away. However, due to popular demand, we've reprinted
the most recent edition, 3.0, in one volume including all updates 3.1 to 3.6.
Note that this reprint contains exactly the same information as in the
previous edition and updates. It's available from Radio Sweden for USD 3, GBP
2, SEK or FF 20, or 7 IRCs or DM. Please DO NOT send orders for the
forthcoming edition 4, as it is still in preparation! (George Wood)

SWEDEN--The influx of commercial programs from abroad appearing via cable
systems on Swedish television screens seems to have had an effect. Last
Friday a study was presented to Minister of Culture Bengt Gransson on the
future of commercial television in Sweden.

At present, there is no advertising broadcast over the air in Sweden. The
public service Swedish Broadcasting Corporation has two non-commercial TV
channels. The study presents four alternatives, one of which is no change at
all. Other options include permitting advertising on Swedish Television's two
channels, or splitting one of the current channels away from the corporation,
and financing it with commercials.
```

But the option that is favored in the study is the creation of a third TV channel, independent of the Swedish Broadcasting Corporation, and financed by a maximum of 6 minutes of commercials an hour.

The proposal comes following the success of TV3, a commercial service to Scandinavia based in London and broadcast via the Astra satellite. According to reports TV3 is expected to show a profit by next year, much earlier than expected.

Swedish Radio had a problem last week, when sound engineers staged a wildcat hours. Instead of all 100 engineers sharing the job of working at night, only a select group would work nights. The others would then have to work more during the week, which would add up to 5 weeks more work a year. (George Wood)

AFGHANISTAN--(Updating SCDX 2056) Radio Afghanistan in broadcasting in German at 18:30 on 9665 kHz. 11755 kHz remains in parallel. (Hermy Reischl, Austria, Uwe Gruner and Karl Heinz Leuther, West Germany)

AUSTRIA--Radio Austria International's new schedule in French is: 07:30-08:00 and 12:30-13:00 on 6155 and 1373 kHz, at 16:30-17:00 on these two frequencies and 21490 kHz, at 18:30-19:00 on 5945 and 6155 kHz and at 21:30-22:00 on the two latter frequencies and 9870 kHz. (Francois Chalory, France).

BANGLA DESH--Updating SCDX-2059, the external service of Radio Bangladesh seems to have some trouble keeping its frequencies. The English broadcast at 18:15 has now been heard on 17714 kHz. (Gerard Mc Guiness, Ireland)

CANADA--Radio Canada uses the new frequency of 13650 kHz for its broadcasts to Western Europe after 20:00. (Francois Chalory, France)

CUBA--Updating SCDX-2056, Radio Havana Cuba has a one hour Broadcast in English to Europe at 22:00-23:00 on a new frequency of 9685 kHz. (Aristides Giannarelis, Greece). This frequency is also used by the Voice of Turkey at 22:00 which makes both unlistenable. Radio Havana was heard on 15180 kHz at 20:00. (Gerard Mc Guiness, Ireland)

CZECHOSLOVAKIA--Radio Prague has introduced a new broadcast in German at 05:30-06:00 on 7345, 6055 and 9505 kHz - a repeat of the previous evening'sprogram. (Lorenz Wiedemann, GDR)

FINLAND--Radio Finland has retimed its evening broadcast to the Americas: 00:00-00:25 on 9645 and 11755 kHz. (Joe Hanlon, USA). French can be heard on medium wave (254, 558 and 963 kHz) at 00:25. (Francois Chalory).

Radio Finland has introduced weekly 5 minute round-ups in Classical Latin. The round-ups will be aired in most of our English broadcasts between 09:30 Sundays and 13:00 Mondays, towards the end of the block. The producers believe this is the only news program in Classical Latin in the world. (Juhanni Niinistoe, Radio Finland)

FRANCE--Sud Radio, based in Toulouse, has closed its transmitters in Seron et Arveyres and has thus dropped its MW frequency of 819 kHz. Sud Radio has only one 20 kW transmitter active in Gaure (near Toulouse) between 03:00 and 18:30. The private station is instead developing an FM network in the South

West of France. (Michel Morisse, France)

GDR--Radio Berlin International made some changes in its new schedule from September 24th: at 01:30 on 6010 kHz, at 07:30 on 15240 kHz, at 09:30 on 9770 kHz, at 11:30 on 9770, 13690 and 21465 kHz and 23:30 on 6010 kHz. (Karl Heinz Leuther, West Germany).

WEST GERMANY/CANADA--Radio Canada International discontinued broadcasts in German on September 29th. To encourage letters of protest, the German DX associations the ADDX and the AGDX are forwarding reports and letters about Radio Canada International free of charge until October 15th. (Karl Heinz Leuther in "Kurier", West Germany)

IRAN--The Voice of the Islamic Republic of Iran is now broadcasting: In English, at 11:30-12:25 on 1224, 7215, 7230, 9695, 7190 and 11790 kHz; at 14:00-15:00 on 702 kHz; and at 19:30-20:30 on 9022 and 11895 kHz. In Spanish, at 01:30-02:30 on 6145, 9022 and 15084 kHz; at 05:30-06:30 on 9022, 9745 and 15084 kHz; and 20:30-21:30 on 9022 and 11895 kHz. In German at 18:00-18:45 on 9022 and 11895 kHz. In French at 06:30-07:30 on 9022, 9745 and 15084 kHz and at 18:45-19:30 on 9022 and 11895 kHz. In Russian at 15:30-16:30 on 1404, 1449, 7230, 9022 and 11790 kHz and at 19:30-20:30 on 1404 kHz. (Winfried Baumann, West Germany)

IRAQ--Updating SCDX-2053, Radio Baghdad in English to North America at 01:30-03:20 is back on its previous frequency of 9515 kHz. (Joe Hanlon, USA)

IRELAND--Updating SCDX-2060, the new commercial station Atlantic 252 broadcasting on 254 kHz has an Irish adress - Mornington House, Summerhill Rd, Trim, Co. Meath, Ireland. (Gerard Mc Guiness, Ireland)

KUWAIT--Radio Kuwait was heard on the unannounced frequency of 21675 kHz at 18:30 in English. 11665 kHz remains in parallel. (Bengt Johansson, Portugal).

ROMANIA--Radio Bucharest has replaced 11810 kHz with 7225 kHz for its broadcast in German at 18:00 and 19:00, thus interfering with the German transmission of the Voice of Indonesia. (Karl Heinz Leuther, West Germany).

SRI LANKA--The external service of the Sri Lanka Broadcasting Corporation is about to discontinue its Japanese broadcasts. The reason: the only announcer is going to emigrate to the USA! (Hiromasa Fujii, Japan).

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
02:30 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21655 kHz (East Africa)
18:00 hrs on 1179, 6065, and 7265 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

23:00 hrs on 1179 kHz
00:00 hrs on 1179 kHz

And to Asia and the Pacific:

12:30 hrs on 15190, 17740, and 21570 kHz
14:00 hrs on 11905 and 17740 kHz
01:00 hrs on 7225 and 9640 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 29 contributors this week Good Listening!

BID: RTDX0610

RTTY DX NOTES FOR WEEKENDING 6TH OCTOBER 1989 (BID RTDX0610)

BEFORE ENTERING YOUR NEXT CONTEST, MAKE SURE THAT YOU HAVE A GOOD LAWYER, OR A HIGH COURT JUDGE BESIDE YOU TO INTERPRET THE RULES. FROM COMPLAINTS THAT I HAVE RECEIVED, IT WOULD APPEAR THAT MULTIOPERATOR ONE TRANSMITTER (OR SINGLE TRANSMITTER) COULD ALSO MEAN MULTIOPERATOR ONE TRANSMITTER AT A TIME ON ANOTHER BAND. SO YOU HAVE FIVE OPERATORS WITH FIVE TRANSCEIVERS OPERATING ONE AT A TIME ON DIFFERENT BANDS. MAYBE IT MEANS THE SAME THING. GEE, I WISH THEY WOULD MAKE THE RULES CLEAR FOR US BUSH LAWYERS.

THE BANDS THIS WEEK HAVE BEEN VERY BUSY , ESPECIALLY WITH SOME GOOD DX REPORTED. IT LOOKS AS THOUGH THE BANDS ARE SLOWLY IMPROVING, WITH 28 MHZ SHOWING SOME EXCITEMENT AS WELL.

OUR THANKS THIS WEEK GO TO TG9VT, G3XTL, W0LHS, VE3JPC, N2HOS, VK2EG, JA1BLV, I5FLN, AND OD5NG. THANKS CHAPS FOR YOUR INTEREST.

ROD, 5Z4BH WAS VERY DISSAPOINTED WITH THE CQWW CONTEST, AS HE COULD NOT GET THE GEAR GOING PROPERLY. HE LEFT THE GEAR WITH 9X5AA FOR THE MOMENT, AND HOPES THAT HE WILL USE IT. HIS NEXT OBJECTIVE IS T5, WHERE HE HOPES TO BE SHORTLY.

JT0DX HOPES TO BE OPERATING FOR A FEW MORE WEEKS.

RON, ZL1AMO WILL BE IN THE NORTH COOKS FOR A FEW WEEKS YET, AND WILL BE UP ON RTTY SHORTLY.

VU2JX, JS, INDICATES THAT HE HOPES TO GO TO A51 (BHUTAN) IN FEBRUARY WITH THE SPONSORSHIP OF THE AMATEUR RADIO ARM OF ROTARY INTERNATIONAL. THAT SHOULD CAUSE A SMALL DOGPILE.

THERE HAS BEEN NO SIGN OF 5A (LIBYA) AS YET. WHO KNOWS WHAT HAS HAPPENED THERE?

THE FREQUENCY FOR ZS8MI MAY APPEAR TO BE WRONG, BUT THAT IS THE ONE THAT I GOT, AND CHECKING BACK, I GET THE SAME REPORT.

GL DE DX1.

============================================================
| Relayed from COMPUSERVE |
| N8EMR's Ham BBS, 614-457-4227 (1200/2400/19.2 telebit,8N1) |
============================================================

#: 108861 S5/Amateur Satellites
09-Oct-89 16:55:14
Sb: AO-13 Emergency
Fm: Bob McGwier N4HY 74615,1366
To: ALL

AMSAT has declared a spacecraft emergency. Until further
notice OSCAR-13 users are asked not to use any transponder
which might be found active from OSCAR-13.

For yet unexplained reasons, the IHU aboard OSCAR-13 crashed
sometime at or near perigee between orbits 1012 and 1013. The
crash occurred between the hours of 07:00 and 10:00 UTC
on the 9th of October according to OSCAR-13 command station
DB2OS. OSCAR-13 command stations would be interested in any
telemetry captured between those hours on the 9th of October.
Anyone who has any data captured during that time frame
should either post such material to AMSAT-DL on Telemail or
contact AMSAT president Doug Loughmiller, KO5I at (214) 784-
0194 who will make arrangements to forward it to DB2OS and
the other command stations.

Again, it is very important that all activities aboard OSCAR-
13 be suspended until the OSCAR-13 command team determines
the nature of the problem at hand. All AMSAT volunteers are
asked to help spread the word of the suspended activities in
their areas.

AMSAT will provide updated information through normal
communications channels as soon as it becomes available.

Everyone's cooperation is greatly appreciated in this matter.

3184. Re: Field Day... OK... A proposal:

Newsgroup: rec.ham-radio
Date: 1989-10-10 00:41:57 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500223@ux1.cso.uiuc.edu>
Source record: 16396

Another idea for FIELD DAY...

Since we all know exactly when Field Day will be, we end up making long term (often 11 or 12 months) preparation. This is not to say that being prepared is bad (it is in fact very good), but it does not really test how well we are prepared for an emergency (it tests how well we can prepare given a long advance notice).

POP FIELD DAY

In addition to the regular summer and winter field days (which make us BE prepared) there should one more field day which will be held with a very MINIMUM of notice (perhaps 24 hours or LESS). A designated person will decide on the date and make the announcement with the appropriate amount of lead time. There should also be a FULL 48 hours of operating as part of the POP FIELD DAY. Not everyone will get the word fast enough, so this gives lots of people a chance to get in even if late.

Who should be the designated person?

From: storkus@arrakis.nevada.edu
Message-ID: <890@unsvax.NEVADA.EDU>
Source record: 16399

Using a larger size wire will do 2 things:
1. Increase your bandwidth (due to skin effect; more surface area = less rf resistance, too). Pipes and ground strap should make it VERY broad-band, if you're that brave.
2. It will shorten the resonant length.

I am not sure of the exact equations, but that's how it works as I understand it. Someone else can probably tell you more. Also see the ARRL handbooks and antenna books. 73's,

::::::::::::::::::::::::::::::::::
```

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Agnes Carbon.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2063

PUBLICATIONS--Edition 4.2 of Radio Sweden's "Communications in Space: The DXers Guide to the Galaxy" is now available free of charge from Radio Sweden. This 13 page publication covers satellite radio and television, weather and other "utility" utility satellites, amateur radio in space, and the American and Soviet space programs.

We're still updating our book "The DXers Guide to Computing", and edition 4 is still several months away. However, due to popular demand, we've reprinted the most recent edition, 3.0, in one volume including all updates 3.1 to 3.6. Note that this reprint contains exactly the same information as in the previous edition and updates. It's available from Radio Sweden for USD 3, GBP 2, SEK or FF 20, or 7 IRCs or DM. Please DO NOT send orders for the forthcoming edition 4, as it is still in preparation! (George Wood)

SWEDEN--The influx of commercial programs from abroad appearing via cable systems on Swedish television screens seems to have had an effect. Last Friday a study was presented to Minister of Culture Bengt Gransson on the future of commercial television in Sweden.

At present, there is no advertising broadcast over the air in Sweden. The public service Swedish Broadcasting Corporation has two non-commercial TV channels. The study presents four alternatives, one of which is no change at all. Other options include permitting advertising on Swedish Television's two channels, or splitting one of the current channels away from the corporation, and financing it with commercials.

But the option that is favored in the study is the creation of a third TV channel, independent of the Swedish Broadcasting Corporation, and financed by a maximum of 6 minutes of commercials an hour.

The proposal comes following the success of TV3, a commercial service to Scandinavia based in London and broadcast via the Astra satellite. According

to reports TV3 is expected to show a profit by next year, much earlier than expected.

Swedish Radio had a problem last week, when sound engineers staged a wildcat hours. Instead of all 100 engineers sharing the job of working at night, only a select group would work nights. The others would then have to work more during the week, which would add up to 5 weeks more work a year. (George Wood)

AFGHANISTAN--(Updating SCDX 2056) Radio Afghanistan in broadcasting in German at 18:30 on 9665 kHz. 11755 kHz remains in parallel. (Hermy Reischl, Austria, Uwe Gruner and Karl Heinz Leuther, West Germany)

AUSTRIA--Radio Austria International's new schedule in French is: 07:30-08:00 and 12:30-13:00 on 6155 and 1373 kHz, at 16:30-17:00 on these two frequencies and 21490 kHz, at 18:30-19:00 on 5945 and 6155 kHz and at 21:30-22:00 on the two latter frequencies and 9870 kHz. (Francois Chalory, France).

BANGLA DESH--Updating SCDX-2059, the external service of Radio Bangladesh seems to have some trouble keeping its frequencies. The English broadcast at 18:15 has now been heard on 17714 kHz. (Gerard Mc Guiness, Ireland)

CANADA--Radio Canada uses the new frequency of 13650 kHz for its broadcasts to Western Europe after 20:00. (Francois Chalory, France)

CUBA--Updating SCDX-2056, Radio Havana Cuba has a one hour Broadcast in English to Europe at 22:00-23:00 on a new frequency of 9685 kHz. (Aristides Giannarelis, Greece). This frequency is also used by the Voice of Turkey at 22:00 which makes both unlistenable. Radio Havana was heard on 15180 kHz at 20:00. (Gerard Mc Guiness, Ireland)

CZECHOSLOVAKIA--Radio Prague has introduced a new broadcast in German at 05:30-06:00 on 7345, 6055 and 9505 kHz - a repeat of the previous evening'sprogram. (Lorenz Wiedemann, GDR)

FINLAND--Radio Finland has retimed its evening broadcast to the Americas: 00:00-00:25 on 9645 and 11755 kHz. (Joe Hanlon, USA). French can be heard on medium wave (254, 558 and 963 kHz) at 00:25. (Francois Chalory).

Radio Finland has introduced weekly 5 minute round-ups in Classical Latin. The round-ups will be aired in most of our English broadcasts between 09:30 Sundays and 13:00 Mondays, towards the end of the block. The producers believe this is the only news program in Classical Latin in the world. (Juhanni Niinistoe, Radio Finland)

FRANCE--Sud Radio, based in Toulouse, has closed its transmitters in Seron et Arveyres and has thus dropped its MW frequency of 819 kHz. Sud Radio has only one 20 kW transmitter active in Gaure (near Toulouse) between 03:00 and 18:30. The private station is instead developing an FM network in the South West of France. (Michel Morisse, France)

GDR--Radio Berlin International made some changes in its new schedule from September 24th: at 01:30 on 6010 kHz, at 07:30 on 15240 kHz, at 09:30 on 9770 kHz, at 11:30 on 9770, 13690 and 21465 kHz and 23:30 on 6010 kHz. (Karl Heinz

Leuther, West Germany).

WEST GERMANY/CANADA--Radio Canada International discontinued broadcasts in German on September 29th. To encourage letters of protest, the German DX associations the ADDX and the AGDX are forwarding reports and letters about Radio Canada International free of charge until October 15th. (Karl Heinz Leuther in "Kurier", West Germany)

IRAN--The Voice of the Islamic Republic of Iran is now broadcasting: In English, at 11:30-12:25 on 1224, 7215, 7230, 9695, 7190 and 11790 kHz; at 14:00-15:00 on 702 kHz; and at 19:30-20:30 on 9022 and 11895 kHz. In Spanish, at 01:30-02:30 on 6145, 9022 and 15084 kHz; at 05:30-06:30 on 9022, 9745 and 15084 kHz; and 20:30-21:30 on 9022 and 11895 kHz. In German at 18:00-18:45 on 9022 and 11895 kHz. In French at 06:30-07:30 on 9022, 9745 and 15084 kHz and at 18:45-19:30 on 9022 and 11895 kHz. In Russian at 15:30-16:30 on 1404, 1449, 7230, 9022 and 11790 kHz and at 19:30-20:30 on 1404 kHz. (Winfried Baumann, West Germany)

IRAQ--Updating SCDX-2053, Radio Baghdad in English to North America at 01:30-03:20 is back on its previous frequency of 9515 kHz. (Joe Hanlon, USA)

IRELAND--Updating SCDX-2060, the new commercial station Atlantic 252 broadcasting on 254 kHz has an Irish adress - Mornington House, Summerhill Rd, Trim, Co. Meath, Ireland. (Gerard Mc Guiness, Ireland)

KUWAIT--Radio Kuwait was heard on the unannounced frequency of 21675 kHz at 18:30 in English. 11665 kHz remains in parallel. (Bengt Johansson, Portugal).

ROMANIA--Radio Bucharest has replaced 11810 kHz with 7225 kHz for its broadcast in German at 18:00 and 19:00, thus interfering with the German transmission of the Voice of Indonesia. (Karl Heinz Leuther, West Germany).

SRI LANKA--The external service of the Sri Lanka Broadcasting Corporation is about to discontinue its Japanese broadcasts. The reason: the only announcer is going to emigrate to the USA! (Hiromasa Fujii, Japan).

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
02:30 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21655 kHz (East Africa)
18:00 hrs on 1179, 6065, and 7265 kHz
21:00 hrs on 1179, 9655 and 11705 kHz
23:00 hrs on 1179 kHz
00:00 hrs on 1179 kHz

And to Asia and the Pacific:

12:30 hrs on 15190, 17740, and 21570 kHz
14:00 hrs on 11905 and 17740 kHz
01:00 hrs on 7225 and 9640 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 29 contributors this week Good Listening!

3188. UoSAT 1 / OSCAR 9

Newsgroup: rec.ham-radio

What's the latest with OSCAR 9's orbit? Has any re-entry time
been calculated?

I'm sad to see this fine satellite nearing the end of its life.
I 'grew-up' listening to OSCAR 9's friendly *rrrrreeee rrrrreeeee*
sound of telemetry coming down and funny little voice. I credit
this bird for getting me interested in space science and engineering.

and, if anyone at U. of Surrey is out there, I'd like to say JOB
WELL DONE!

3189. Cellular Mobile phone antennas.

Newsgroup: rec.ham-radio
Date: 1989-10-10 08:24:40 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <10.Oct.89.09
Source record: 16398

Just to point out that cellular mobile phones do 'ramp' the transmitted
power up & down (on the basis of the received signal strength) so as to
transmit the bare minimum signal needed to be heard at the base station.
This stops you hitting too many cells at once when youre on top
of a mountain. (or airplane-mobile??)
If you install a massive, high-gain antenna on your mobile, then you'll
receive a stronger signal from the base, but the base will receive a
strong signal from you, and will command your mobile to turn the
wick down a notch...!
Rather tends to mask any changes in antenna efficiency, what?
Thats why they do it - to allow easier re-use of cells in a limited
frequency domain.
(but if the base can't hear you, you sure wont make any calls!)

I recall that newer ones produce reasonably well at 750-1000 rpm.

>Another friend of mine seems to think that a good wind-based scheme
>would beat water hands down,but he has yet to convince me completely...

One of the EE professors here at KState spent several years studying
wind-energy production. One of his many conclusions is that if the
wind does not AVERAGE at least 11 (ELEVEN) miles/hour, then it's not
worth your time & effort to try to harness it. And that's a LOT of wind.

I have a small (6-foot, 200 watts @ 12volts DC) windcharger up about
25 feet, and while it usually keeps my battery charged (all of my
radios: hf, 2-meter, scanner, packet, etc.) run off of 12 volts,
sometimes I have to add a little juice from the power company. Of
course, my QTH is down in a valley, but the above-mentioned professor's
wind charts show that the east half of Kansas just does NOT average
enough wind (no matter what the Wizard of Oz might have thought!-)

Since the sun shines more than the wind blows here, I'd like to get
rid of my windcharger. I've already purchased a bunch of 4" solar
cells and will put them up the pole in place of the windmill
"Real Soon Now".

3195. The 14.313 war fades away

Newsgroup: rec.ham-radio
Date: 1989-10-10 14:59:51 UTC
From: flash@lopez.UUCP
Message-ID: <872@lopez.UUCP>
Source record: 16422

Talk about a change. What was once the haven of insanity has now become a rest home. The WAR on 313 seems to have fizzled. A chain of events seems to have taken care of the problem.

1. KA4MUJ "got wind" of an "FCC plot" to "get him". He signed off one night never to return to the frequency.

2. KV4FZ lost his home and rig in Hurricaine Hugo, and even today is still running on Battery Power. He and MUJ were the two that drew the most QRM and VILE COMMENTS. When Herb does hit the frequency, there are a few epithets, but NOTHING like the "good old days".

3. The MARITIME and INTERCON have moved permanently to 14.300, where they continue to provide service as usual, and do not seem interested in taking 313 back.

4. This leaves N5FS by himself. He starts the day with "code practice" to grab the frequency, but he has lost a lot of steam. Usually after a few hours of "N5FS, Better Amateur Radio Information Net, ANYBODY?" he goes away.

The funny thing is that the frequency is now a rag chew frequency. I chatted for almost an hour with a mobile there one day totally unmolested.

And the absolutely HILLARIOUS thing happened on Saturday. I was napping when a WEST AFRICAN called CQ on 14.313. He called and called and called. I was just so comfortable in bed that I never came back to his Q-5 signal. Someone else finally did, and they had a chat, and then the INEVITABLE 20M Pileup began. Missed a chance to add a new one to the logbook <sniff>.

I expect that when Herbie gets his tower back up and they finally do get Power on St. Croix (that is sure an amazing situation if you ask me, they are still without phones or power there), things might heat up again.

BUT FOR NOW.

Peace reigns on 14.313.

Yawn.

My wife and I have obtained a used OMEGA enlarger at a swapfest, she to make black and white prints, myself to make contact prints of circuit board layouts. But the thing is partially disassembled, and there's no manual. It's a model B-22 enlarger, s/n 848815. It says SIMON OMEGA, Woodside, NY 11377 on the nameplate, but a call to directory assistance yields no number. Anyone out there have a manual or know where I can obtain one? Thanks!

Do keep in mind that reading/writing to the usenet is not ham radio. On the usenet, the only filters are the "next" and the "kill" key. When you get into ham radio, you can select whom you associate with. If you don't like the ravings of the armchair lawyers or the CB bashers, it's OK. They like themselves well enough anyway, and you don't have to hang out with them. Get involved with a club or an ARES section or traffic handlers or other people who DO things. It's not really fair to judge what ham radio is by reading this newsgroup.

I understand this is not a flame, it probably deep concern that many
TRUE hams share for what is going on these days, BUT.....UUCP net
IS NOT HAM-RADIO. Although i do enjoy this forum, (sometimes even
the nit-picky stuff is amusing enough to make me read it) to really
find out what is going on in the HAM world, you need to listen on
the air, and contact your local radio-club to get involved. I am
sure you will be greeted with open arms and lots of insight.

> Most of the discussions were about hams operating in a NON-civilized manner
> or about discussions on whether non-hams should be allowed to buy ham
> equipment or not. Hey guys what happened to the hard core HAMS that discuss

> happened to HAMS that support and encourage the uninitiated, like me, to get

We are busy giving code tests and helping folks put up their first
antenna and helping them find a rig and explaining what a 1010 number
is and......sometimes we have time to check out the UUCP band.
> As a person that spent almost half of my life studying electronics I think
> the pleasure of only talking to HAMS around me is only half the game. I derive
> as much satisfaction from building stations as well as using them. Is it
> against the law, nowadays, for hams to build their own stations ??
Lots of folks still "Home-brew" gear. What has happened though (IMHO)
is that the sophistication of gear has progressed to the point where
it is hard to duplicate the quality of manufactured rigs at home and
more people are becoming intimidated by the technology, thus becoming
"Appliance operators" more that pioneers. You gotta be pretty good
these days to do true "Pioneering". BUT: If you don't mind alot
of work, and less than store-bought specs, home-brewing is the most
satisfying of efforts. It may be ugly, it might be junk parts, but
to make that DX contact on something you made yourself has got to
be one of the most rewarding feelings in radio. (educational too).

> Can somebody, please, give me some incentive for joining ? I am NOT
> discouraged but I AM disappointed.
Obviously you already have the incentive. I will offer some BIG
encouragement though. Once you work your first DX station and start
having fun, all the disappointment will fade like 10m at night.......

> as part of the POP FIELD DAY. Not everyone will get the word fast enough,
I like this idea, 24 hours notice should be a real challenge. I also
think part of the scoring (or multiplier) should be based on HOW SOON
you got on and made the first contact after the notice. I would not
even want to pin it down to a particular time of year, however, it
might be nice to say that it would be at least 3 Months after the
previous one. Suggestion: Call it EPE for emergency preparedness
event. Scoring should place emphasis on emergency preparedness
qualities, like putting a portable kilowatt on the air in less than
an hour seems to be a good quality in a crunch, and should be re-
warded. We need more thots on this one.

> Who should be the designated person?
W1AW, who else?? I think anticipating an event like this would also
serve to shore-up organization within clubs and individuals. I would
personally like to know that a friend would call me immediately if
he heard the announcment first. This just might tighten us all up
just a bit.....

>the radio needs to be licensed. I forget the form number, but I'll bet anything
>the number and perhaps even a copy of it will come in the users manual of the

It is my understnading that the Restricted Permits are still issued (and
required) for international operations. So if you sail across the lake
to Canada or into international waters, then you should still have one.
The same permit is used by pilots. Many pilots have had problems with
the FCC returning their forms, saying they didn't need the permits for
domestic radio communications. If you need want a permit, include a note
with your application stating that you will be using it for international
travel.

Customs in Canada HAS asked to see my permit, when clearing customs
at Toronto Island Airport.

Finally, the form needed for the aircraft/ship radiotelephone license
filled out once, and not needed at renewal. I filed for fleet licenses,
and therefore do not have to do paper work when changing vessels/aircraft.
I do not have anymore duplicates of that form, but if emailed, will get
the number. The license is a Form 559 for either ship or aircraft.

The fastest method of getting information on aircraft/marine licenses
is to call the FCC Gettysburg, PA Private Radio Bureau office.

Since this is an oft asked question I am posting my oft-sent answer
about the vritues of PC HF Facsimile from Software Systems Consulting.
I have no connection with this company, I'm just a satisfied customer.

PC HF FACSIMILE 4.0 is a $99.00 IBM-PC compatible hardware/software package.
For your money you get a demodulator (an RS232 hood with wires ending in a
mini-phone plug), a disk containing capture program, a manual, and a
tutorial cassette.

From my experience it works very well. The Demodulator attaches and is
powered by the PC's serial port. Installation involves plugging it into
the radio and the PC. Dead simple (assuming you have a serial port).
The software must be customized for your PC. You have to chose which
flavor graphics adaptor you have (CGA, EGA, VGA, etc). You must also
define timing parameters depending on you PC's clocking - this is the
trickiest part I found.

The program allows color or B&W reception of 60/120/180/240 LPM fax.
It includes a rudimentary tuning scope display which allows you to
set Black and White signal levels. You can zoom, pan, reverse video fax
images. You can save and load from disk, and there is an unattended mode
which allows you to specify a template file name to which subsequent
faxes will be sent (each has a version number appended to the root file
name). The program supports Epson printers and HP laser jets for output,
and there is a conversion program included which allows you to change
stored faxes to some PC graphics file format or other.

The manual is quite good and has a reasonable listing of WEFAX freqs.
The tutorial cassette is OK if you don't know what a fax broadcast
sounds like, but you can't capture images off tape, so it's useless for
setup.

I use this package with my Sony 2010 & get good results, *suprise* (with
an active antenna). I can get WEFAX from Pt. Reyes (shooting ducks in
a barrel), Hawaii and Virginia *acceptably*. I do wish I had a better
radio and antenna, since you can't expect much from FAX DXing under the
best circumstances. You need to shield the radio from the computer as
much as possible and connect them to a common ground to reduce noise
from the computer degrading transission. I've logged Japanese newspapers

and even a NX wire pic (barely), using the other modes.

I don't expect this package will stand up against the like of a PK-232,
but hey, it's 1/3 the price and if you just want WX maps, it'll do.
For info contact:

Software Systems Consulting, 1303 S. Ola Vista, San Clemente, CA 92672
(714) 498-5784

Spend the money you save on getting a better radio :-) and an antenna tuner,
you'll really need it.

> happened to HAMS that support and encourage the uninitiated, like me, to get ithe game ?

We're out here. A lot of us still design, build, and experiment. The nature of the projects has changed somewhat, however. Used to be, you could build a transmitter or receiver that could rival the performance of the commercial stuff of the day. That is no longer true- the appliances have gotten very good. Today, a lot of guys build power amps, preamps, and other "accessories" for their stations. Most of the guys who are the "serious" builders are the ones who frequent the VHF/UHF/Microwave bands, where there is still ample reason to "roll your own". I fit into this description, keeping my Kenwood TS-930 for use making skeds on the upper bands.

If you want to build, don't let the apparent lack of fellow home-brewers discourage you from getting into ham radio- most of us are just real busy and don't post here frequently. Most clubs have a few (at least) folks who are your type- search 'em out!

BTW, good luck and I hope you DO join us.

#: 108861 S5/Amateur Satellites
09-Oct-89 16:55:14
Sb: AO-13 Emergency
Fm: Bob McGwier N4HY 74615,1366
To: ALL

AMSAT has declared a spacecraft emergency. Until further notice OSCAR-13 users are asked not to use any transponder which might be found active from OSCAR-13.

For yet unexplained reasons, the IHU aboard OSCAR-13 crashed sometime at or near perigee between orbits 1012 and 1013. The crash occurred between the hours of 07:00 and 10:00 UTC on the 9th of October according to OSCAR-13 command station DB2OS. OSCAR-13 command stations would be interested in any telemetry captured between those hours on the 9th of October. Anyone who has any data captured during that time frame should either post such material to AMSAT-DL on Telemail or contact AMSAT president Doug Loughmiller, KO5I at (214) 784-0194 who will make arrangements to forward it to DB2OS and the other command stations.

Again, it is very important that all activities aboard OSCAR-13 be suspended until the OSCAR-13 command team determines the nature of the problem at hand. All AMSAT volunteers are asked to help spread the word of the suspended activities in their areas.

AMSAT will provide updated information through normal communications channels as soon as it becomes available.

Everyone's cooperation is greatly appreciated in this matter.

If it's what you say it is, it is incredibly cheap! Solar panels in the low-tens of watts run about $8.25 per watt for the panel alone. (Antennas West: 23W Sovonics panel for $189.) Your source would weigh in at $2.25 per watt, including storage, which makes it competitive with commercial power sources! (Decommissioning costs alone for a 1 GW nuclear power plant are estimated as high as $3.93 per watt.) I suspect it is a 12.5 *watt*, not *amp* panel, which makes it a very expensive $32 per watt.

Also suspect is the part. The system you describe would require about 500 sq ft for the panel alone.

Beware of voltage and current ratings. Solar panels should be rated peak watts at equatorial noon. Sleazeballs may spec them at peak open-circuit voltage and peak short-circuit current. Open-circuit voltage for a 12VDC charging system should be about 19 volts -- if it is much less, than you are getting less than the standard number (36?) of series-connected cells. It may still work in full sun, but off-peak voltage will drop below the 13.8V needed for charging -- you'll only be charging for a few hours around noon.

But these are probably engine speeds. My 1986 Ford Ranger has a driveshaft pulley diameter of 5.75" and an alternator pulley diameter of 2.25", so the slowest the alternator ever turns (engine idle at ~780 rpm) is ~ 2000 rpm. At idle, it will put 15 amps into my metered "aux" battery, plus whatever it's putting into the starting battery.

Given that the complexity and cost of producing electrical power goes up with decreasing speed, I don't see any reason why automotive alternators would be expected to be useful at below engine idle speeds. Anyone have more conclusive data?

Mail ordering the Sony ICF 2010

This is in reply to Dave's question about ordering the Sony from EEB .....I have found EEB to be a first class outfit. I used to live in Northern VA....near EEB and have found them to have it all together.....their service department is super because Ted is a real hot dog tech....he even did a few jobs for me on gear that I did not buy from EEB!

3215. How to avoid breaking tuning slugs in coils?

Newsgroup: rec.ham-radio
Date: 1989-10-11 00:00:37 UTC
From: rfc@briar.philips.com
Message-ID: <65283@philabs.Philips.Com>
Source record: 16337

I have this problem: About 5% of the coils I try to tweak, I end up breaking the ferrite core instead of rotating it. When that happens, it jams in whatever position it was at. I then have to chisel it out, and find a replacement slug to stick in the coil. I am aware that you need to use the proper size plastic hex tool. (these slugs have a hex shape hole down the center, and the coil form is made of plastic). Is there some trick to this? Like a drop of oil (yuck!) on the slug? Or maybe my tool is worn out?

Thanks in advance

I'm interested in finding other's interested in the very early history of radio and electronics (i.e. circa 1900). I doubt there are many folks here that are into this but I'd like to hear from any that are. I am a member of the Antique Wireless Association and various antique radio clubs which are interesting if not a perfect fit. I'm just wondering if there are others on the net interested in trading email on the subject. Got any strange friends that babble about "coherers", "thermionic valves" or "audions?" Send them my email address.

Shortwave broadcasters not only have to obtain the license, but they also have to QUARTERLY apply for frequency-hours to broadcast in. This is why so many stations are changing schedules every 3 months.

3220. Yet Another Misinformation Issue

Newsgroup: rec.ham-radio
Date: 1989-10-11 00:44:03 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500226@ux1.cso.uiuc.edu>
Source record: 16334

Here is an example of how a confusing issue can get started. This is one of those issues concerning what is legal and what is not. Ordinarily this issue will get people arguing, but when the misinformation factor is so heavily involved as it is, the arguments are more often the result of people who believe the same way and have a different knowledge level of the real facts.

Spec-Comm recently had a headline concerning the FCC position that fast scan ATV would not be legal on 434 Mhz. The real issue was of course whether or not REPEATERS of ATV would be legal. The Spec-Comm article did refer to repeaters, but it did not make things all that clear that this is all that the FCC was concerned about. The headline alone was definitely misleading.

Now there will be people trying to argue that ATV is in fact legal on the entire 70cm band, and will argue against people who really trying to say that repeaters are not allowed in 431-433 Mhz nor 435-438 Mhz as specified in FCC rules (47 CFR 97.205(b)). Both are correct, but the arguments will create a lot of bad feeling between hams that just does not need to exist. Hams have enough controversial issues and don't need false ones being created as well.

3221. Beacons and FCC rules

Newsgroup: rec.ham-radio
Date: 1989-10-11 00:44:07 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500227@ux1.cso.uiuc.edu>
Source record: 16335

97.3(a)(6) Automatic control. The use of devices and procedures for control of a station when it is transmitting so that compliance with the FCC Rules is achieved without the control operator being present at a control point.

97.3(a)(9) Beacon. An amateur station transmitting communications for the purposes of observation of propagation and reception or other related experimental activities.

97.203(d) A beacon may be automatically controlled while it is transmitting on the 28.20-28.30 Mhz, 50.06-50.08 Mhz, 144.05-144.06 Mhz, 220.05-220.06 Mhz or 432.07-432.08 Mhz segments, or on the 33 cm and shorter wavelength bands. (note: changes in these frequencies are pending based on an ARRL petition and an FCC Notice of Proposed Rule Making).

Since the FCC rules specifically address AUTOMATICALLY CONTROLLED BEACONS in 97.203(d), the does not seem to be any way for 97.203(d) not to come into effect for such beacon operations. Thus it seems to me that beacons for the purpose of direction finding and fox hunting activities are restricted to the frequencies in 97.203(d). The "fox" is usually unattended and not under any remote control during such activities, so it easily falls into the category of an AUTOMATICALLY CONTROLLED BEACON. An argument might be made that since the "fox" is turned on and off only when an amateur operator is in attendance to it, that it is not really unatteneded when control takes place. The counter arguement (one the FCC might use in a hearing) is that all radio transmissions must be under control at all times by either an operator in attendance or by automatic control as specified by the rules; any transmitting must be under some sort of control at all times in order to comply with FCC Rules.

Now, putting "fox" transmitters on the beacon frequencies is possible to do, and the new ARRL proposed beacon frequencies even allow other emission modes besides CW. However, there is already a network of beacons in these narrow ranges of frequencies which could receive interference (rather, those who are monitoring these propagation beacons would receive interference). Would it not be better that flexibility exist to place "fox" type beacons on other frequencies? They are usually placed there now (and fortunately, no one has complained to the FCC about it). We could prevent these problems with the rules by going ahead and trying to make a few changes to allow these kinds of activities legally.

There are actually a number of different ways the rules could be changed to readily allow "fox" beacon flexibility. One idea I thought of would be to specifically define this type of beacon and allow it to be placed on any amateur frequency (except frequencies shared by amateur-satellite) that the "fox" operator was authorized for.

The most radical idea I have thought of so far is to further de-regulate beacon operation, and let beacons be subject to constraints similar to repeaters, including exclusion from certain frequencies such as 145.8-146 Mhz, 431-433 Mhz, and 435-438 Mhz.

What do people think? No flames... just civilized discussion, please.

Hi,
I would like to say I'm sorry ahead of time if I am posting in the
wrong place....

I have a cousin who will be doing graduate studies in a rather primitive
area of Africa for 6 months starting in January.

She is very interested in a small short-wave radio that can be used to
pick up the VOA and the BBC. She doesn't want to DX at all, just hear
some sounds from home.
I offered my GE World Monitor for her use, she laughed. It is much to larg
and takes 6 "D-Size" batteries.

What she is looking for is a small radio that will work well with Nicads
and a small solar-recharger that will allow her to listen to the VOA or
BBC every other day.

She is willing to spend up to $250. Can it be done?

Many thanks,
Steve

I have developed an interest in packet radio, in particular I am interested in the operation of same under Unix/Xenix.

I am however, a bit bewildered by the selection of packet controllers on the market.

I would appreciate hearing your views or experiances with various brands and/or models.

I am concerned with reliability, flexibitity and upgradability as well as the ease of use.

To date I am leaming towards the KAM and PK-232 but I may be making a mistake in either case. Your input would be greatly appreciated!

Thanks,

Noel

Try Radio Shack for a Novice Preparation course. It is $19.95 and includes a book and two casette tapes. The book has every possible question that can be on the test, the correct answer and an explanation of the answer. The two tapes will teach you morse code and get your speed up to the required 5wpm. It worked for me so well on my Novice and Technician tests that I am using their General book and tapes to prepare for the test this coming Sunday.

3229. Re: How to avoid breaking tuning slugs in coils?

Newsgroup: rec.ham-radio
Date: 1989-10-11 12:49:41 UTC
From: brian@ucsd.Edu
Message-ID: <10052@ucsd.Edu>
Source record: 16358

Back in the old days (AHHHG! OLD FART ALERT) when I was tuning up Motorola T44 on 450 MHZ, I used to break about 1 tuning slug in 5 - I remember being told that Moto's reconditioning program included sloshing the radio with some sort of solvent that caused the coil form wax to harden after a few months, locking the slug in place. These also were the kind of slugs that had a bronze springwire lengthwise to ensure that they didn't vibrate out of adjustment when the radio was shaken to death by being installed on the firewall of a concrete mixer.

Anyway, removing the coil can (when possible) and blasting the coil with a hair dryer to soften the wax would often loosen the slug enough that you could get it out, then dip it into talcum powder to lubricate it, and return it to the coil form and tweak it up.

When the slug DID break, you ran an electric drill down the center hole of the slug, which turned it into crunchy little bits that were easy to shake out by banging the radio on the concrete floor.

Of course, this was back in the days of real radios, before rice rockets and the day the ARRL invented FM. Modern ham-market stuff is a bit less well-engineered and would probably shatter into a thousand bits if you banged it on the garage floor. I sure wouldn't try it with my Kenwierd. But then you could drive a car over a Motorola radio without hurting it. And they cleaned up real nice when you ran them through the dishwasher.

The hair dryer trick works great on rice rocket radios too, but since the Japanese manufacturers often use gobbets of wax to hold components onto the board, you have to fit the blower with a small snout (off an oil can, for example) to avoid total radiophonic meltdown when you're loosening a slug to twiddle it.

Another trick is to just stick your soldering iron tip into the coil slug for a few seconds to heat it up.

But the real trick is to use the right tuning tool. If your diddlestick fits the slot or hex in the slug just firmly, and doesn't slop around, you run a much better chance of turning the slug instead of breaking it. I have a quiver of about 20 diddlesticks and I still occasionally run into slugs that I don't have the right one for. Most hams are cheapshitbastards, but spending $10-$20 on an assortment of good quality diddlesticks is one of those investments you'll always regret not having made.

Assuming you're not afraid to take the covers off and work on your own equipment, of course. I wonder how many hams have even LOOKED inside their radios?
- Brian

A couple of years ago my wife and I were visiting in The Netherlands
and toured EVOLUON, a museum-like place in Eindhoven owned by Philips
Company (they own Norelco, Signetics, and North American Philips here
in the USA). Anyway, one of their displays is about radio, and part
of that display has a very old setup containing a coherer. Having
tried to make one in my youth, I set about explaining how it worked to
my wife; while I was so doing an Evoluon employee overheard me, intro-
duced himself, and then activated the display for actual operation!
So I got to send some Morse code from their sparkgap transmitter to
their coherer-based receiver over a distance of at least ten feet! :-)

Back in my youth I got interested in water power after reading an article
in Popular Science (remember when that was a high tech rag).
They explained the whole thing from start to finish including giving the
addresses of companies that sold smal Hydro-Electric generators.
It wasn't till much later that I learned why no one does it. It seems that
there is not enough flow or control in a free running stream, hence the
reason for things like Boulder Dam. And that of course brings up the major
stumbling block.
It seems there is this real estate law called riparian (sp) rights which
says you can't block or impede the flow of any stream or body of water that
flows thru your property. Kind of puts the skids to any kind of private
hydro generating station. I have had it explained to me by local authorities
that even putting a water wheel into the streem can be construed as "impeding
the flow". That may vary from locallity-to-locallity but at least here, I
probably could not legally generate my own electricity using water.

And of course, wind power is a whole new ball game. You thought your
neighbors hated the sight of your antenna. :-) :-) :-)

From: JORDAN@LL.LL.MIT.EDU
Message-ID: <8910120721.AA21302@ucbvax.Berkeley.EDU>
Source record: 16354

About 6 months ago I got a Heath SG-8 rf sig. gen. from a hamfest.
When I tried it out at home, I found it didn't oscillate on the low
frequency end of the top 3 bands. I presumed this was a low-gain
problem (High C with the same L implies low Q & low gain). The
tube was a 12AU7 twin triode. Last week I got a replacement from
another Hamfest. It turned out to be a 12AU7A. Works fine on all
but the highest freq. band, where it doesn't work at all...
Do any of you old-timers out there still have a handbook with
receiving tube data & can tell me what the difference between the
various 'flavours' of 12AU7 are? I would also really like to get my
hands on a photocopy of the manual, or the schematic at least - so
I can see what Heath originally recommended. Anyone willing to supply
copies pse E-mail direct - I will of course pay the costs.
Maybe I should just reduce the supply voltage & replace the triodes
with FETs - a winter project maybe...

Thanks & 73s

It is probably normal. The aviation band was limited to 108-136 MHz,
with 136-138 in "reserve".

> Thank you. Arun WC6V

The standard aircraft radio microphone circuit requires a carbon microphone, i.e., a variable resistance. True carbon mics have several disadvantages including poor audio quality; no self-respecting ham would use one. Modern aircraft mics are "simulated carbon", i.e., they are electret or dynamic mics with a preamplifier circuit which simulates the electrical characteristics of a carbon mic and is powered by the microphone bias current from the radio. High-quality simulated-carbon mics which don't work with ham rigs are available cheap at hamfests. See _Ham Radio_ magazine, October 1981 p. 18. for a circuit for adapting them to typical ham transceivers. (Copy for SASE.)

Unmodified Plantronics StarSet headsets will work with the Icom IC-2AT family of transceivers; just add appropriate connectors and series PTT switch. This has been published in most ham magazines.

Should anyone be planning to come to Eindhoven to the Evoluon (possibly to
see some radio history), I must disappoint them. The Evoluon is closed and
will not be opened again, at least not as a museum of electronics.
If memory serves, it will be used by Philips as an exhibition of the history
of the company itself.

A good package for getting started in Amateur Radio is "Tune in the World
with Amateur Radio" from the American Radio Relay League.

Their address is 225 Main St, Newington, Ct 06111
It costs $15.00 (book plus code cassettes order #0380) or
$12.00 for book only (order #0399).

Get a copy of QST magazine at your local book store and there are lots
of products that are designed to get you started at a minimal cost.

The Gordon West Courses are also quite good (advertised in QST and other
magazines such as 73's Magazine and CQ).

> he heard the announcment first. This just might tighten us all up
> just a bit.....

Now that I asked, and now that at least one answer has arrived, I'll toss out what I was thinking of and see who likes it or hates it.

One of the things that would be needed is VERY FAST dissemination of the announcement of the simulated emergency preparedness exercise. In a real emergency how would we hear about it? For one thing, the news media would be heavily involved. We need to get the news media going on it. The idea I was thinking of was to ask that none other than the President of the United States (who is afterall Commander-in-Chief of the Armed Forces) be the one to decide when and make the announcement. It could be suggested that he might tag the announcement at the end of any major media speech just as means of getting the word out in a way that would approximately match a real life emergency. It might take some major begging to get him to do it, or maybe it would be easy, BUT JUST IMAGINE THE MEDIA AWARENESS as a result !!!

Can someone who is into aviation (and ham radio, too) give a summary of the available aviation headsets? I'm personally interested in having one that is very comfortable to wear for long periods of time (I suspect pilots have to some times) AND very good noise blocking on the earphones (yes, TWO) and noise cancelling on the boom mike. Included should be what the prospects are of modifying them for use with ham gear (HT's, mobile rigs, base rigs, etc).

>
> John De Armond, WD4OQC

John, I agree with you 100%

I'd like to add that the idea of all the fee money going directly to the Federal treasury may not be that bad of an idea. If the FCC keeps the money, then we don't have as much control over it as we would if Congress allocates it. Congress SHOULD ordinarily allocate back to the FCC all of the funds the FCC collects in all its processing. We should expect the fees (for all services) to let the FCC pay their own way. Then if the FCC is FAILING to meet its obligations, Congress can put more pressure on them to do so.

The processing fees can also allow a resumption of certain kinds of more costly processing such as vanity callsigns and club stations.

I would like to stress that one particular type of processing needs to continue to be ZERO COST, and that is filing a change of station location and/or mailing address. It would not only be unfair to people who have to move more often, but it would be important for the FCC and hams to make sure the FCC records and database is kept up to date. If there was a cost to file a change of address, some people would find excuses and reasons to avoid filing the change just to avoid the costs. Too many people don't file them now as it is; why make it worse.

And a license fee would probably be a better filter to keep out the riff-raff than that other method :-)

3244. ATV Balloon Landing

Newsgroup: rec.ham-radio
Date: 1989-10-11 16:43:41 UTC
From: look@uicsrd.csrd.uiuc.edu
Message-ID: <54900004@uicsrd.csrd.uiuc.edu>
Source record: 16368

The ATV balloon package was found intact and still operating in a soybean field five miles east of Lebanon, Indiana. The package was found by the Indianapolis fox-hunters who had been near that area. Assisting were John Huisinga KA9YPK and Tim O'Connor KA9SZY in a chase plane. The package was picked up forty minutes after landing. The only damage was the dislocation of the mirror used to provide downward views to the camera.

Anyone who taped the flight is asked to contact :

look@uicsrd.csrd.uiuc.edu
or
Mark Garrett KA9SZX
513 Jackson
Champaign, IL 61821
or
K9CW PBBS (QSL)

Video was recieved as far away as West Virginia and southern Canada and fifteen miles east of DesMoines, Iowa. The 42 milliwatt signal of the 2 meter beacon was copied in Kansas City. The package achieved an altitude of at least 114,700 feet and traveled down range at speeds up to 125 mph.

More information and photos will be available in an upcoming Amatuer Television Quarterly magazine.

3245. FT-470 UHF out-of-band mods

Newsgroup: rec.ham-radio
Date: 1989-10-11 17:19:43 UTC
From: ewb@raybed2.UUCP
Message-ID: <1389@raybed2.UUCP>
Source record: 16356

For all of you who may be wondering wether an FT-470 will go out of band on UHF, I have some bad news. A phone call was placed to Yaesu by a local tech/dealer asking specifically if it could be done. The tech at Yeasu didn't know for sure but would get back to him. Well Yaesu did and here is the answer. They FT-470 is made in 2 styles, one that is imported and one that is distributed to the rest of the world. It seems that the ones that are sold outside the US can do the trick as they have a different micro-processor than the US versions. The ones in the U.S. cannot due to the soft/firm ware in the micro. A few of the "export" versions were sold in the US early on, so if you have serial # 1 or whatever, it may do it, but most will not.

BTW if you REALLY DO need out-of-band UHF and VHF capability YAESU makes a COMMERCIAL version of their DUAL BANDER. I believe it's called the model 2005. Check with your local Yaesu dealer or Yaesu USA. It can probably be programed into the ham bands.

From: mac@idacrd.UUCP
Message-ID: <478@idacrd.UUCP>
Source record: 16372

Thanks to Gary for bringing my message over from CIS. I should have
already sent an update. IMHO, a software bug was uploaded or uncovered
as we have completely regained control, and the hardware all checks out
on AO-13. It is quite easy to leave some JUNK around on the stack by
forgetting to do some stuff. The spacecraft runs a multitasking system
based on IPS (an extension of Forth by Karl Meinzer, DJ4ZC, see his article
on same in an old BYTE magazine article). If you leave junk on the stack,
and it returns from a subroutine call and it blows you out into the weeds,
you could easily get the exact behavior we got. James Miller, G3RUH,
reset the IHU easily and he, Graham Radcliff, VK4AGR, and Peter Gulzow
DB2OS, got software in, checked out the hardware, and are about ready
to let people back on. The transponders are definitely under computer
control and OFF. As soon as you can use them, we will issue a bulletin
to that effect.

From: koning@koning.dec.com
Message-ID: <5332@shlump.nac.dec.com>
Source record: 16369

It depends. If you want to obey the National Electric Code, then it does. The code has requirements on minimum wire size. What the minimum is depends on (a) how long the antenna is, (b) what material (copper vs. steel (copperweld) vs. aluminum), and (c) whether it's a transmitter or a receiver antenna. Read the NEC.

Re the Gordon West article about TS440 mods:

It is not necessary to Reset the processor in the TS440 after making the mods. The TS440 reads the diodes on every powerup, not just on a processor reset.

Among other things, this means you could put a switch on the general coverage diode, and select general coverage vs. ham-band-only transmit from the outside of the box. Cycling the power will cause it to take effect. People with transverters might want to use this property.

Contact TI. They have several CCD's. I just recently ordered
from a TI supplier a TCS241 [754*488 area CCD with support chips.] It was
$401 US. They also have a TC211 which is a 192*165 low cost CCD that
needs an external shutter but cost less then $50 US. Try asking for their
new Optoelectronic Data Book. TI has an Optoelectronic Branch
in Dallas [1-214-997-3382] - they could likely give you a number
for a TI rep near your area.

Good Luck!,

3251. Re: ARRL and User Fees

Newsgroup: rec.ham-radio
Date: 1989-10-12 00:40:32 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500231@ux1.cso.uiuc.edu>
Source record: 16373

One of the reasons I joined the ARRL was the understanding that it was an organization that (at least CAN) represent the views of ALL amateurs.

It is clear that with the cut backs in QST being grossly slanted against certain particular areas of interest, that QST, and thus ARRL, is being an organization that represents JUST SOME GROUPS of amateurs. This is not what I want to be a member of, and unless some action is taken, I, too, will not renew my membership when renewal time comes up (9/90). I just recently decided to renew just because the ARRL voted to petition the FCC to create a (not exactly perfect) no-code class of amateur license even though my own director voted against it. I did let them know why I renewed and I hope they took note of it.

I will be writing to them and expressing my concern that through its main publication QST, the ARRL is effectively becoming an organization that does not make a committed representation of the full diversity of amateur radio. I will of course support organizations that represent and support limited areas of amateur radio activities THAT I AM INTERESTED IN. I will also support organizations that are very general purpose. The ARRL is clearly taking a direction away from being general purpose, and towards a direction I happen to be not interested in.

So if QST had to cutback 25%, then why not cut 25% out of each area? Since they did NOT do that, it's obvious they don't want to represent all amateurs.

+I haven't listened recently, but a while back when I
+listened to CBers blatantly taking over the bandwidth
+just below the 10 meter band some of them even bragged
+openly about their power amplifiers and gave out their
+addresses over the air for QSL cards. I wonder if the
+FCC ever goes/went after them...
+ Arun WC6V

Not just below. The space between CB and 10 meters is currently unallocated (27.410-28.000) and in the L.A. area it has become 'Hispanic CB'..lately they have been using 28.0-28.3 as well. The Truckers too have discovered that they can 'have a quiet channel' in this area. Nominally without a fight..

I've bitched and complained about this for 4 years solid, I've written to my ARRL SM, I've written to the FCC, I've even T-hunted the bastards down and given the addresses to both our local FCC office and the OO's. I've been trying to get some support to have the matter resolved via diplomatic channels between the US and Mexican Governments...none of which has done a damn bit of good! There have been about 10 people from this very newsgroup (you KNOW who you are!) that have written me and said "Yeah, we're with you on this..let's get 'em!" And they've done the same things..letters, and more letters..all to no avail.

It seems, given the influx of inexpensive gear to cover the 26-30MHz band, with all-mode (CW,AM,FM,SSB) capability, and given that such equipment is being sold to CBers at MOST EVERY CB STORE, TRUCKSTOP etc...we, as Amateurs had best decide to either rise up and actually DO SOMETHING about it..or we can look forward to losing 10 meters to the bootleggers.

<side point>
I have endured tons of hateful, shitty, email from a collection of human-scum that cruises this newsgroup, owns and operates equipment out-of-band and refuses to become licensed, or recognize that 10 meters is lawfully allocated to the Amateur Service. They scoff at us...they seem quite sure that the Amateur community will never get off their asses to do anything whatsoever about their illegal operations. Are they right?

There are those individuals, on 11 meters, that have a reasonable attitude and more than enough courtesy to use CB radio for it's intented purpose; but the other side of the coin is there too. It has been my experience, that most (not all!) CBers, given enough encouragement and support, make fine Amateurs.

And why not? They have an active interest in RADIO. They are willing to LEARN. They have some experience at operating the equipment, and most have some experience at the basic skills of electronics as applied to transceiver

installation, setup, or modifications.

I have personally Elmer'ed 7 individuals, all of whom started out on CB. I was never so happy as the day they all passed their Novice exams. BTW-they took the exams from a local VEC that I have little contact with, since I'm still only a Tech.

(In-Letter PS to the hate-mail crowd)
What does all this mean? IT MEANS I HAVE NO BIAS AGAINST 11 METER OPS, UNLESS they insist on bootlegging, cranking up the power or smashing up the rules in some other fashion. So, you little-jerks, no more bitching about my having an ax to grind about CBers in general! I was once there too.. ..and we simply didn't talk to people like you! It was considered in bad taste use 'dirty-30's' or kick on a Linear or not ID or hang carriers..etc. You cannot defend any of this kind of behavior, it's simply out of line!

(back to the topic)
The FCC will do nothing. The ARRL will do nothing...unless someone insists on them doing so. And it had better be soon, unless we like the idea of the CB band being 26-30 MHz, in which case the SCUM will have won..simply via inaction on the part of the Amateur community. Think about it, 10 meters is riding on *YOUR* decision.

Persons interested in DOING SOMETHING about this problem are encouraged to write me. Flames to /dev/null...

A higher gain antenna will not be much of a benefit for cellular
phones since the entire system is designed with automatic power control of
the mobiles and will adjust the power levels to maintain specific limits.
It is also unlikely that you would be able to get into channels in adjacent
cells unless you are equally distant from the two cell sites in which case
you would be handed off between the two until you capture one of them.
There is some hysteresis during these handoffs which is on the order of
4db. When a cell phone is first turned on,
it scans through all of the control channels and locks on to the strongest
one which, hopefully, is one that is in the same cell as you.
When you want to place a call or you receive a call, your set is still on
the control channel passing data which include power level adjustment and
voice channel assignment. Your voice channel assignment will be a channel
in the same cell site as you.
All during your conversation there is an overhead data stream that will
automatically adjust your power depending on how close to the cell
site you are. The range of adjustment is 28 dB in 7 steps. This means that
your power will range from a maximum of 3 watts to a minimum of about 5
milliwatts. So, if the cell site determines that your signal is too strong
it will cut you power back or if it is too weak it will step you up.
This dynamic adjustment of power by the cell site would defeat the
purpose of using a higher gain antenna. The best improvement that you could
make is to install the antenna properly. Any departure from a well
installed antenna with a good ground plane (center of the roof) will degrade
the performance.

The power limit for the mobiles is nominally 3 watts at the antenna connector.
With the typical 3db gain antennas, this puts the ERP at about 6 watts ERP.

Right - they should take those propagation charts and leave out a
quarter of them (MUFs from the West Coast to Japan, I wouldn't miss
that at all), they should list QSL managers only for stations whose
call letters start with A-S, leave out the rest, list upcoming contests
for the first three weeks of each month only - and of course when they
print pictures of the ARRL board they should trim the photo so that we
don't see anything below the knees.

So, where are interesting radio museums?
When I was in Leningrad in June, I located a Communications Museum,
but when I got there was told that they were renovating.
The science museum (I forget the name) in London is interesting (I
went in as default during a tube strike, and didn't want to come out),
but it's not all radio. There is a ham station there, but it wasn't
run that day.

3261. Re: Does It Matter How Thick Antenna Wire Is?

Source record: 16277

The only time you should be real concerned about the diameter of the wire
is when the Length is Short (Like above 50 Mhz, and for sure over 500 mhz)

You see there is a factor is the electrical length that is based on the
Length to Diameter ratio, if the diameter is large the antenna will be
broader and shorter, but on HF you don't need to worry about it much...

For an HF antenna I would not worry about it, except for making sure
it is strong enough to withstand the weather...

I usually use 12 or 14 gauge Copper Weld (Copper coated steel)
and remember the wire does not have to be taunt!

Now if you were to use 2-4 wires with spacers about 3-4 inches apart you
could have a nice broad antenna for a good chunk of 80M...
(That's the wires are 3-4 inchea apart, at rf it would look like a solid
pipe...)

Please do not let what you see on the NEWS-groups discourage you, this is
a totally different world from being on the air.

If you were to listen (watch) the evening NEWS you would then not want to
venture outside, all they do is talk about the BAD things...

There are many areas of the bands that are a bit boring after a while, but there
is a lot out there to enjoy!

Also remember that more often than not people like to flame and argue at
each other on news groups...

I would compare this news group to others and I think you might see that
there is a fair percentage of good stuff here...

And as with any ongoing discussion there are many horses that get beaten
to death... like the code wars... you were not seeing us at our best...
it's a very emotional topic...

besides a very very small percentage of hams are represented here...:>

73, Tom, W2VY

Source record: 16285

Wow, I'm only 32 and I feel like an old fart. I've been a ham since I was 12 and it seems like the same old controversies continue to circulate: the ARRL doesn't support us, code vs nocode, HF knuckleheads vs VHF wierdos, people who don't have whatever the latest mode is (SSB, SSTV, packet) blasting those who do, etc. I guess its healthy, although in the age of electronic mail reflectors and packet mail forwarding, I'm afraid that new hams leaping into the digital side of the hobby are going to think Wayne Green must be a typical ham (he's not, OK?).

In ARRL blasting, the latest series of comments has followed the usual path of thinking of the ARRL as the amorphous (sp?) "they", as if there were this giant jellyfish spitting out QST each month and singing the Wouff Hong song. In reality, there are three important parts to the league: (1) QST, and an editorial staff and writers who produce it, (2) all the various elected directors and division whatevers who are put into office by (3) ARRL members, who pay their dues, get a magazine, and fill out ballots.

If you don't like an article in the magazine, complain to the writer. If you don't like QST in general, complain to the editor. If you don't think there is enough technical content, write an article. If you don't like the action of an elected director or whatever, complain to him or vote against him, or run for office yourself. If you don't like what a member does, complain to him.

In general, ham radio has gotten to where it is today (which despite all the gloom and doomers, is a pretty amazing place) by the actions of many self motivated individual amateurs. Hams haven't needed the ARRL or industry trade associations or hit top 40 songs to spur advances. As long as I've been a ham, there have been moaners and groaners, pissing and moaning about this mysterious "them" who aren't doing what "we" need to have done. And I've noticed the P and M'ers are never running for office, or giving novice exams, or writing technical articles. The full expression of opinions is an important freedom we have, the taking action to change thing we don't like is an important responsibility that goes along with it (strains of "From the Halls of Montezuma" grow in volume here, cut to shot of sunrise over the Iwo Jima memorial).

For those of you new, or prospective, hams who are getting your major exposure to amateur radio from this mail listing, please don't. Get on the bands and make some QSOs. Yeah, yeah, sort through the dueling maritime mobile nets, and the 80 meter Pig Farmers, and the WA4Dogs of the world, and you'll meet a lot of pretty solid people. You'll learn a lot, from an old fart W3 or a johnny novice KB6. You'll have a lot of fun, and have a lot of choice. Join a ham club and go out on Field Day or do two meter support to a local disaster preparedness drill. Get on a contest and work WB2EKK on all bands.

For those who are interested, there is the Canadian Royal Signals Museum
located in Kingston, ONT. It only covers one small piece of radio history
but I still enjoy visiting it every couple of years while I vacation in
Canada.
And while your in Kingston, The Royal Military College (their answer
to West Point) and Old Fort Henry are pretty interesting too. Not radio
related but maybe a good way to appease the rest of the family for dragging
them to a radio museum. :-) :-) :-)

>
> So, I understand that some of the fine foke on Usenet are attempting to
>set up an on-the-air "net" on weekends.

Well, actually I would not call it a net. Maybe a chaotic dis-organization of interested parties, yes; net, no. (Hey, sounds a lot like usenet, doesn't it? :-)

>...
> Why not join us every Sunday at 1615 and 2215 UTC on 28.4 MHz, + or -
>a few kHz if there's QRM...

> GET IN ON THE FUN...BE LISTEINING FER YA THIS SUNDAY!!
>

Well, if the Saturday un-net were really a net, I'd probably go along with this. However, its not at all a net, just a place and a time. Also, that would be 10am and 415pm here, and I'm busy both those times, so would not be able to join the Fido net anyway.

Since I plan to be on 10m (almost) every Saturday anyway, I'll continue the 'tradition' (?) of an un-net, as long as nobody minds too much. (Remember, I'm not trying to take away from the FidoNet Net. Really I'm not! If I get massive email telling me that continuing the un-net is a -bad thing- then I will change the comments about it in my .sig (but I will *still* be on 10m most saturdays at 1500Z, since thats the time I've set aside for HF Hamming, so I'll probably make some kind of comment about saturdays no matter what.))

And on a slightly different subtopic of the same subject:

I've been talking to someone in California who has asked that we try to hang around for people like him who find 8am CA time to be too early to be up. So if a few East Coasters (:-) would not mind hanging around for the California folks until at least 1600Z, they would probably appreciate it (at least, Alan would :-). I've also heard from someone who would most likely not be available until 1700Z. So don't think that it quits at 1600Z...

(In fact, I expect to be on from 1500 to at least 1800 if the band warrants it. However, if it turns out like last week, I'll go work on my antenna!)

So, I'll be looking for *you* on 10 on Saturday. Remember - only 48 states left for usenet WAS! :-)

While I've got your attention, I'll bring up another question someone asked me. Should we totally ignore the ARRL and set up our own QSL system? It has been suggested that we could send a QSL via email, and if you *really* want some paper for your wall, we could come up with a postscript-able QSL card (send it to your PS printer, and viola! If PS is not good, we could go with some (ntg)roff format based card or such). (I'm going to have to look up the 'rules' the ARRL has for QSL cards so I know what I'm suggesting that we ignore!) Anyway, any thoughts? (Email and I'll try to summarize, but most likely what will happen is you will see your email quoted, including your address - so be aware that emailing me about the QSL idea will likely result in your becoming (in)famous on usenet :-))

'nuff fer now.

---Join the usenet un-net, 28.410 and/or 28.390, 1500Z to 1600Z saturdays!

3268. Re: Sony ICF2003 vs Panasonic RFB60

Newsgroup: rec.ham-radio
Date: 1989-10-12 21:05:30 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <8910130702.AA13362@ucbvax.Berkeley.EDU>
Source record: 16298

The Panasonic RFB60 has now been replaced by the B65 model; this was reviewed last week by Larry Magne on RCI SWL Digest. They are very close. Magne explicitly compared the two. (His reviews usually appear in print in the following month's Monitoring Times, if you want to wait.)

The B65 can tune in 1 kHz steps, and has a better tone quality than the Sony. But the Sony's IF filters are a smidge narrower and thus it beats the Panasonic on selectivity. The Panasonic has knob tuning, but it isn't terribly easy to use. The Panasonic has more memories, but they are in banks and can't all be used for whatever you want. The Sony only has 10, but they can be anything.

It comes out as a toss-up.

Will

Message-ID: <8910130139.AA06025@cmr.ncsl.nist.gov>
Source record: 16299

You folks (might) be interested in the slightly different letter I just received from Paul Rinaldo (W4RI), editor of QST. BTW, I've know Paul slightly for quite a few years, ever since he was the leading organizational light in AMRAD * .
-------- copied material follows ---------
Oct 5, 1989
Dear Bob:

John Lindholm passed your letter about The New Frontier along to me for reply. QST is committed to covering the microwaves, but with a different emphasis. We are keenly aware of the need to encourage microwave activity and to get more amateurs active on the bands above 432 MHz. We think that the best way to do this is through comprehensive feature articles, rather than through a monthly column, that by virtue of its size, can present only bits of information. For example, we devoted 20 QST pages in May, June and July to easy-to-build microwave gear. We are committed to publishing such articles in the future.

As far as a regular presence in QST, news of microwave operations will continue to receive coverage in The WQorld Above 50 MHz. And, we're working on the presentation of the standings boxes in Bill's column to reduce the space they take. [RJC note: I had suggested keeping their content in a smaller font.]

ARRL is serving the needs of the microwave community much better, in many more ways, than we did in the eraly 1980s when The New Forntier column began. For example:
[The following entries are condensed.]
> ARRL has published over 1000 pages of Central StatesVHF and Microwave Update proceedings so far.
> Operating activities and awards.
> 1990 ARRL Handbook has some 70 pages of UHF and microwave eqpt and ants.
> "It's overdue, but we are progressing on a microwave book."
> QEX carries UHF and microwave info.
[End of condensation]

ARRL is not deemphasizing microwave activity; rather we're shifting the way our support is delivered.

Sincerely,
Paul Rinaldo, W4RI
Editor, QST
---------- end -----------
SO, there we have a "commitment" to microwaves from the Editor of QST. I'm as interested as the rest of you as to how well he succeeds. From our acquaintance of years ago, I would say his OWN interests lie more in

packet radio, national packet nets and spread spectrum, than in RF items.
He was also interested in means to increase the throughput on HF
packet links.

Pardon the lengthy posting,
Bob W3OTC

Personally, as both a ham and occasional CBer, I think the interest in CB has peaked several years ago. Living in the New York/New Jersey area, I find far less chatter and far less garbage on any of the CB channels I listen on. Even driving in the car these days you find far less people with CB's.

I don't know what, if any, push might be on for more CB channels, but all you need to do is scan the 40 channels in Northwest NJ and you'll find many with no activity. I think with that type of use, there wouldn't be much reception at the FCC for more channels.

Along those same lines, I drove cross country last year on an 8500 mile trip and found that once you are not in a Metro area, the CB channels, and I mean litterally all the channels, go silent.

As opposed to the CB folks, by far the greatest threat to ham bandwidth is, and will continue to be, the commercial interests.

Just some food for thought.

I am doing a project on HF communications. It involves developing a soft-decision decoder for HF signals such as RTTY or packet radio signals. These signals are demodulated with an FSK or PSK demodulator. The output of the decoder is sampled, and fed into the computer. The computer does the decoding to improve error correction when the signal is bad (fading, clicks, bursts etc), "by using as much as possible". The final goal of the project is to implement a real time soft decision decoder.
The project will be done at the University of Nijmegen, dept Computer Science. A telecommunications station PI5KUN is available, with amateur HF transceivers.
I am looking for articles and other information.

Please send them to me by email or by mail .

Mark... The very latest issue of Radio Electronics has an article
on connecting the Radio Shack Electronic COmpass to a computer system.

To make a long story short, they have an excellent discussion on
fluxgate magnetometers as a part of the article, including a description
as to how the windings are made (a control winding goes totally around
the core [ring] and a sine and cosine winding exist at 90 degree angles
to each other). Check out this article for at least a "feel" as to how
these devices are constructed.

3277. Alternators

From: MJK2660@RITVM.BITNET
Message-ID: <8910140702.AA02489@ucbvax.Berkeley.EDU>
Source record: 16325

I have a problem not at all related to ham radio but I've noticed
some comments on vehicle alternators recently and though I'd
ask. I have a 82 VW Rabbit, diesel variety. The alternator light is
on. The alternator is good, bench tested it at an alternator shop.
The alternator has a built in regulator. I have checked the wire that
goes the alternator that supplies voltage to start the field, and the
voltage is about 2 volts. I have some problems with the wiring near
the fuse box and at this point I don't wish to deal with this
mess (this is a back up to my "winter" car and for $500 I couldn't
go wrong). My question is can I run a switched, fused wire from the battery
directly to the "field coil" connection on the alternator?
Thanks for your help!

3279. Locking coil slugs.

Newsgroup: rec.ham-radio
Date: 1989-10-13 14:22:03 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <13.Oct.89.15
Source record: 16323

If you've rebuilt some gear and realigned it, rather than locking the tuning slugs with wax (which will harden and make you likely to crack the slugs next time you realign it), try and get hold of a piece of elastic. If you tease the fibres out, you will end up with some very fine threads of rubber. If you hang one of these into the core before putting the slug in (dissolve off any remaining wax first) then screw in the slug, you will find it holds the slug beautifully. In five years, when you next need to realign the rig, the rubber thread will have perished, but its remains still hold the core. When you turn the slug, the rubber breaks into tiny pieces and allows you to unwind the slug. Put in a new rubber thread, and off you go. I have *NEVER* had a slug crack if it has been retained in this way.
p.s. if you have seized slugs, try soaking them in some organic solvent (Trichlorethylene, carbon tetrachloride) for a while to soften the wax - but be careful - the coil former may turn into a gooey lump of melted plastic!
If your rig has areas of the PCB coated with wax, be careful - its often the PLL coils/components that are so treated. If you melt off the wax, then the inter-component capacitances will all change, and you may end up having to realign the PLL.

John is right. If more hams would actually get involved, by writing or joining special interest groups, I'm sure many things can be changed. I have a feeling that many hams feel that they are in the minority and have no power to change situations. I don't know why more hams don't get involved; is it apathy or confusion or what? I don't know and may never know. DO SOMETHING positive to change things. Don't just sit around and bitch.

> In general, ham radio has gotten to where it is today (which despite all
> the gloom and doomers, is a pretty amazing place) by the actions of many
> self motivated individual amateurs.

No question about it.....look at people like Phil Karn (KA9Q) with his TCP/IP work and others too numerous to mention who have advanced the state of microwave communications, for example. What about the ATVers, the groups who have set up linked repeaters, EMEers? I could go on and on for hours.

The point is that there are still many areas to explore and develop within the hobby. NOT ALL OF THESE ARE SOLELY TECHNICAL. There is still much to develop in operational circles as well. For instance, traffic handling during emergency and disaster situations could still use more development. How do you do this? Practice...such as that obtained during emergency "exercises". There are many areas of the hobby to get involved with. Whoever tries to tell you that everything has basically been done already is full of it.

But, I digress. Good job John.

From: fe2o3!michael@mimsy.umd.edu (Michael Katzmann)

I contacted a station on 15M last night (10pm ET) from the TUVA soviet republic.
It was RA0/UA9YX on 21295 kHz.
This is the first time I've heard this area of the Soviet Union on Ham Radio.
Perhaps others may be interested. (B T W Tuva is the geographical centre of
Asia)
There was a very funny show on PBS (I think it was Nova) about Richard
Feynmann of the Feynmann Lectures on Physics. He decided to try to visit
Tuva, because as far as he could tell no Westerner had ever been there.
Unfortunately, in the pre-glasnost era, that proved impossible.

Bob,

Why not get a Mitsubishi M57727 25W linear brick? The one in my multiband transverter stack makes 50W out linear and will saturate above 75W when run from 13.8VDC. I don't have the price list in front of me, but I'm sure the Japanese price is $40 or under. RF parts can't get more than double that!

]A higher gain antenna will not be much of a benefit for cellular
]phones since the entire system is designed with automatic power control of
]the mobiles and will adjust the power levels to maintain specific limits.

I disagree. What the automatic power control will achieve is to prevent
the mobile with a higher-than-normal gain antenna from emitting too high
an ERP. On the other hand, when you get down in a hole (like in some of our
canyons here in phoenix) the higher gain antenna will allow you to put
out more power, which the APC will allow since it is controlling based
on received signal strength. This should be a considerable advantage.

On the other hand, there is a physical limit that is rapidly approached
for mobile antennas at this frequency. What you really want is
more capture area, rather than more gain. The reason is that
if the gain gets too high, your radiation beamwidth is so narrow
that it may not include the cellular station, and as the antenna moves
around, it may move in and out of goverage. Capture area
allows you to increase the total power into the receiver, which
lets you work with weaker signals. Unfortunately, there is no
way with one receiver to increase capture area without also
increasing directivity.

With all this ARRL bashing, I'd like to point out one thing: Our government is largely controlled by special interest groups. If it wasn't for the ARRL in there working for amateur radio, there may be no amateur radio to worry about! The ARRL is far from perfect, but I can assure you there are a great many private interests that would be more than happy to occupy our current allocations. The ARRL is the *ONLY* fairly loud voice in Washington that we have. If you don't support the ARRL, your not supporting amateur radio.

If you don't like the decisions they make, fight them! They work for you (if your a member of course). Saying your not going to renew because you don't like a decision is like giving up on your country because you don't like the way things are going in congress. Support the ARRL, they are our best and only tangible voice.

OK, I'll get down now :-)

3289. Edmund's Solar pack

Newsgroup: rec.ham-radio
Date: 1989-10-13 17:47:50 UTC
From: herbster@b11.ingr.com
Message-ID: <6192@b11.ingr.com>
Source record: 16181

Sorry for the confusion, i feel compelled to post the real stats.
The item i thought was expensive, probably is, and reads as
follows from the catalog;

SOLAR POWER PACK -- portable & rechargeable. Provides electrical
power to operate ..... Power output can be switched for 6 or 12v.
Contains 36 solar cells encapsulated on aluminum substrate. Blocking
diode prevents overcharge. Unit can be recharged by sunlight or from
any 12v vehicle. Battery is new Gates cyclon high-power sealed lead
acid rechargeable type. High imact carry case. Two models......

12v at 2.5A 30w (12.25 x 9.25 x 4.25") $219.00
12v at 8.0A 96w (13.5 x 10.5 x 4.25") $440.00

The solar array is built into the lid of the case and is less than
a sqare foot of area. It is obvious that the solar array is only
a trickle charger for the battery. No amp-hour rating provided.

And the EPA will be after me for my water wheel......anyone have
some more creative ideas for spinning an automotive alternator??

> happened to HAMS that support and encourage the uninitiated, like me, to get ithe game ?

I don't know if I qualify as a TRUE ham or not. Your comments made me stop
and think about it though. I still build equipment, write some software,
try to encourage new hams and participate in the club activities and have
even served as an officer of the club here. Like most modern hobbiests,
I spend plenty of money (usually totalled up after-the-fact) on my hobby.

> As a person that spent almost half of my life studying electronics I think
> the pleasure of only talking to HAMS around me is only half the game. I derive
> as much satisfaction from building stations as well as using them. Is it
> against the law, nowadays, for hams to build their own stations ??

With ham radio, like several other hobbies or interests, if you prefer,
the COMMUNICATING is the easy part, hence the part that most people
engage in. Look at computer hobbiests and the bbs'ing over the phone
lines. Communicating is so easy nowadays that most of us find that the
bandwidth of the medium easily exceeds what we have to say. Thus it
follows that the people you hear (see?) on the bbs's and usenet and packet
radio and cellular phones and CB radio and so forth are naturally
the mouthiest. The quantity is high but the quality is low, and you
must learn to filter out the crap. Sorry, but it's a natural result
of easy access to the technology.

>
> Can somebody, please, give me some incentive for joining ? I am NOT
> discouraged but I AM disappointed.

Join for the very reasons you mentioned at the beginning of your letter.
People ARE making contributions to the art in ham radio. People ARE
performing public service in ham radio. People ARE expanding good-will

internationally. Ham radio is like any other PUBLIC function, the
contributions to society will exceed the detriments, or it will collapse.

>
> Thanks

You're welcome and 73,

If the event that needs radio coordination is non-profit, what you might do is approach a local "rent-a-radio" place about loaning radio equipment (and the cooresponding frequency and repeater support if necessary) and let the hams volunteer as the radio operators and coordination support. That will get you operating within the business radio service so everything will be legal by the FCC.

Non-profit organizations don't always get everything free, remember, and they technically have to buy things like any other organziation. They just the tax advantage of attracting donations. But, they don't any rights to make use of the Amateur Radio spectrum for doing these things.

Amateur can and should be used for true emergency communications. It's OK to be all set up and prepared for an emergency, and of course we all know that we usually communicate lots of idle chit-chat just to make sure that the radios are in good working order all the time.

I suppose I should have been a bit more specific about his reason
for being so excited about wind power. He had heard of some
kind of 'vortex based' generator which supposedly generated a
huge wind shadow downwind, thus reducing the minimum wind required.

Seems like he said that a fairly slow wind would result in such
a vacuum being generated at the bottom (intake) of the device
that you had to put a fence around it to keep small animals from
being ingested... (Now, does *that* sound like urban legend
to you? Nah! :-)

Anybody know of such a device? Does it work as well as my
friend wants to believe?
